TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other
foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOOD-WORKER is published in the interest of and reaches regularly persons engaged in the lumber, wood-working and allied industries in Ontario, Quebec, Nova Scotia, New Brunswick, Newfoundland. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN AND WOOD-WORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — JANUARY 1, 1908 — MONTREAL

RETROSPECT AND FORECAST.

At the beginning of 1908 a rather unusual situation confronts the lumbering industry of Canada. Not for many years has there been such a quiet fall trade with such marked regularity in price. In the past there has usually followed such a cessation of business, a slump in price. In fact this has confidently been expected by many who persistently refused to buy throughout the fall, but at the present moment there is very little probability indeed of lower prices, while an upward tendency is confidently expected by the majority. This view is justified by the more hopeful tone noticeable in the statements made during the past week by a number of large dealers. Very likely this opinion is in many cases based on the return of a feeling of confidence among business men in various other lines quite as much as on the immediate prospect for a brisk demand for lumber.

The industry has thus far borne the decreased demand remarkably well, thus evincing a basic soundness that is particularly gratifying. Among lumbermen generally there has been a noticeable lack of embarrassment. Readjustments have of course taken place in wages and other cost items of manufacturing which will prevent any serious loss but which cannot be taken as an indication that prices will come down. In the near future salesmen can be confident of gathering up once more the scattered ends of trades and coaxing them into the old channels of strong demand and stiff prices.

During the present trade lull, however, an opportunity has been afforded for reflection and for criticism of existing business methods. Enormous as has been the demand for lumber in this country during the past few years, it has become evident to manufacturers in some parts of Canada that the rush to build new mills and start in upon a wholesale method of cutting timber has been justified merely by an apparently insatiable demand. In days gone by when the expense of cutting and manufacturing logs was less, the danger incident to having on hand a large surplus of manufactured or unmanufactured material

was not as great as now. But the times have changed. Substitute after substitute for lumber is being put forward with varying degrees of success, but with the inevitable result that what was once a universal material is now confined to certain distinct purposes. Although the amount of lumber being consumed nowadays is enormous as compared with record of former years it is becoming evident to manufacturers and their agents that this demand is more and more becoming a measurable quantity and that indiscriminate preparation for a year's business is hazardous.

It is not therefore difficult to see why the sawmill capacity increased so rapidly. The demand for building material has during the past few years increased enormously and the mills at first found themselves unable to keep pace with it. This was particularly the case in some parts of the country to the south of us where there has of late been a constant rush to build more manufacturing plants and planing mills. Existing mills were constantly behind in their orders and apparently there was plenty of business in sight for new ones. Then last winter and spring came the car shortage due to the increased traffic in all commodities. Buyers of lumber in some cases placed duplicate orders for stock, knowing that there would be serious delays and trusting to a continuation of the previous season's good trade to take care of the belated orders when they should come. These duplicate and, in many cases, fictitious orders lent to the demand such an appearance of unusual strength that builders of mills have tried to keep pace with it. It is therefore just possible that when there is a return to the normal demand the sawmill expansion in some parts of the neighboring republic will have been found to be rather larger than the demand warrants.

This remark scarcely applies to Canada, however. It has been estimated that there are to-day fewer mills operating in Ontario than there were a year ago. The expansion in sawmill building has not equalled the increased demand and this has been one of the principal reasons for the uninterrupted strength of the market. In one thing only, viz., lath, can there be said to have been an over production during the past year. This material has been, and still is, weak. Of other materials there is no surplus stock.

Moreover, when the falling off in demand made itself apparent a few months ago, there were few who realized its significance. Preparations were in contemplation for another enormous cut of logs, had the necessary funds been obtainable. As it is the operator has been spared the necessity of making a choice in the matter of curtailing his output. With the difficulty experienced in financing his operations he will get out only a fraction of his last year's cut and thereby will have saved the situation. Pine, hemlock and spruce are worth every cent for which they are now selling, a fact which will have made itself much more apparent in a few months' time. Then, too, our foreign trade in lumber has increased greatly during the past year and gives promise of still greater growth in the immediate future, with a consequent stimulating effect upon prices.

Throughout the ensuing year there will also have to be faced one or two other problems of more than passing importance. Not the least of these is the question as to whether or not Canada shall prevent the free export of pulpwood to other lands. It is only within the past year or two that the value of our pulpwood limits and the folly of allowing them to be indiscriminately logged, have been adequately appreciated. There is little doubt that before the present year has closed legislation on this subject will have become political history and one of the greatest of the Dominion's assets will have been conserved. In this same connection there is also bound to be an interest awakened in the matter of forestation. The new faculty of forestry is well established at the provincial university and everything points to its healthy growth. While doubt may be felt by some as to the value of an academic training in forestry, few will deny that an influx of trained intellectuality will be of untold good to the industry in its present condition. The days of ruthless slaughter of our forests are past, never to return. Lumber manufacturers are showing themselves ready to take advantage of the increasing knowledge of forestry. New conditions are confronting the lumber trade, and the careless ripping up of logs into boards is no longer possible as the particular needs of particular consumers clamor for attention. Late in the day as it is, the lumberman, the Government and the public must co-operate throughout the coming years to keep the land clothed with the growth of centuries.

RESTORE CONFIDENCE THROUGH ADVERTISING

The best manner in which the manufacturer and jobber can show his confidence in the financial and commercial situation of this country is to begin an advertising campaign the very first week in January. Nothing can be more stimulating than advertising. You may not have the goods to sell, you may wish to curtail credit, but advertise all the same. Keep your goods before the trade. A break in the chain is disastrous. If a merchant slackens on his advertising his present customers or his prospective patrons will come to the conclusion that his business is weak, while so long as he hammers away enthusiastically at a publicity campaign he gives the impression that business is booming with him, and fixes himself in the eyes of the trade as a man of push, enterprise and progress.

Make the good times yourself. Restore confidence by being confident. The best method is by bright, cheerful advertising. Don't go around with a long face, with "blue" stories of "up against it," "down and out," etc., or people will be afraid to do business with you. If every jobber and manufacturer were to begin an advertising campaign in January and announce that the depression had passed, we venture to predict that in a short time an atmosphere of cheerfulness and confidence would be restored to the most gloomy in the land. No man is more constantly unhappy, or succeeds in making others so, than the pessimist. He is out of harmony with things. He loses the true dignity of life.

If every business would go to work with a will to convince its customers that there is no real cause for suspension of business, confidence would be restored almost immediately.

THE OUTLOOK FOR HARDWOOD

(THE HARDWOOD RECORD)

Rays of sunshine seem to be penetrating the gloom of hardwood conditions in every part of the country. The financial situation is easing up everywhere, and mills that have been shut down for weeks are now resuming operations. The wholesale manufacturing trade, which has absolutely refused to place orders except for an occasional car, for six weeks past, is now buying lumber again, and in many cases is placing quite liberal orders. The good sense manifested in nearly all the hardwood producing sections, of cutting down output or shutting down plants entirely, has had a most beneficial effect in the maintenance of values.

Minor sales have been made in the Chicago and other western markets, all through the few weeks of depression, at practically full list prices. The only serious price cutting that has prevailed anywhere has been in the East, where in some cases small operators have sold oak at \$5 off the price that prevailed six weeks ago. It is fully expected that a prompt renaissance of values will prevail in that section, as it is well known that stocks of hardwood have not accumulated to any appreciable extent for two months past. If there is not a hard scramble for hardwood before spring, at top notch prices, the "Hardwood Record" is no prophet. However, it is more than likely that there will be a considerably larger stock of lumber manufactured than has been anticipated for some weeks.

Logging conditions are said to be ideal in northern Michigan and Wisconsin, and with easier money it is likely that original plans will be carried out and a fair stock of northern woods put in. Weather conditions usual at this time of year in the South will prohibit any excess of lumber being produced either in the Mississippi Valley region or in the Mountain districts. The situation, as far as supply and demand go, is excellent.

The export trade is in far from satisfactory shape. Stocks in all the large foreign markets are ample for requirements, and it is feared that an excess of consignments, always prevalent in times of local depression, will cause a lowering of prices on the other side of the water.

The flooring factories are all still fairly busy. In some instances there has been considerable accumulation of stock in warehouses, but the outlook for this branch of the hardwood business is excellent. The veneer and panel manufacturers are having only a fair trade, and in a good many instances have cut down time to eight hours a day, and some to less than six. There is comparatively little accumulation of advance orders, which probably is a good thing. Sales of mahogany remain very good, and the demand is fully up to the supply.

B. C. TIMBER LEGISLATION.

On December 24 last the British Columbia government by an order-in-council placed a reserve on all the unstaked timber in that province, pending decision as to their future forest policy. This has been done, it is said, that the forest wealth of the province may be conserved and to prevent timber being staked merely for speculative purposes.

This policy, it is claimed, has been adopted by the government only after lengthy consideration. The next move in the matter will be watched with interest and will probably be more or less influenced by the Timber and Forestry Association, who on December 14 last, sent out for signatures to various parts of the province the following petition:

Whereas under sub-section 3, section 53, chapter 113 of the Consolidated Land Act of British Columbia, 1906, special timber licenses are annually renewable for 21 years only;

And whereas, a very large proportion of the merchantable timber of the province of British Columbia, variously estimated at from 90 billion to 140 billion feet, and without doubt constituting the most valuable timber asset of the province, has already been placed under special timber license;

And whereas, under present legislation, the holders of special timber licenses must log their lands within 21 years (and in many cases much earlier), on pain of losing title to the timber;

And whereas, the forced logging of this timber within the present time limit for renewal would be exceedingly detrimental (a) to the revenues of the government; (b) to the prosperity of the logging and saw-milling industries; and (c) to the best interests of every citizen as a consumer of wood, and of every industry which requires wood for its continued development;

In particular:

- (a) The annual license fees which now constitute a very large proportion of the timber revenues would cease to be paid as rapidly as the limits were culled and abandoned. The government would also lose half its equity in the royalty by the destruction by fire of the lower grades of timber left standing on the hastily culled lands. These losses to the provincial revenue would undoubtedly amount, in the aggregate, to many millions of dollars.
- (b) The operators—loggers and millmen alike—would be forced into the keenest possible competition in the disposal of their products. There would be a twenty-year struggle with over-production in all lines, greatly to the detriment of legitimate profits on the invested capital.
- (c) The spoliation of more than half of the provincial forest assets within two decades would be nothing short of a provincial and even a national calamity. The twenty-year period of timber slaughter would be followed by a much longer period of timber scarcity and famine prices, with no prospect of relief by timber importations.

And whereas, there is some doubt as to whether the present rate of annual dues on special timber licenses is statutory for the present renewal term of twenty-one years;

Your petitioners therefore humbly pray:

1. That special timber licenses be made renewable at the expiration of the present renewal period of twenty-one years for a further period of twenty-one years;
2. That the present rate of annual rental for special timber licenses be declared to be statutory for the present renewal term of twenty-one years.

CARD OF THANKS.

For the generous support given him in the concatenation recently held at Hamilton and for the unusual success which attended that function Vicegerent Snark W. J. MacBeth desires to thank his comrades in Hoo-Hoo. He also bespeaks on behalf of the order, a continuance of this loyal co-operation and support for the balance of his term of office.

Conservative Lumbering in New Brunswick

BY REGINALD R. BRADLEY, B.A., F.E.
(Forester for the Miramichi Lumber Company.)

In these days, when so much is being said and written in this country on the subject of forestry, it may prove interesting to hear of what is actually being done along these lines by a lumber company operating in New Brunswick.

The Miramichi Lumber Company, incorporated in 1904, acquired at that time large holdings in this province. Further acquisitions of territory have taken place from time to time until now the total holdings of this company slightly exceed 1,000 square miles. Of this area about 200,000 acres constitute granted land, while the balance is held under license from the provincial government. Certain restrictions exist which control the cutting on government ground, but as these restrictions do not differ materially from those imposed by the company in operating its granted lands they do not interfere in any way with the company's working plans.

The limits are situated on the main southwest Miramichi river and its tributaries. The latter form a system of drivable streams, fortunately so arranged that all parts of the timbered areas are rendered readily accessible.

The commercial trees found on these limits consist of the following:—Spruce red, white and black; fir, cedar, hemlock and hardwoods. At the present time, however, red spruce alone is lumbered on a large scale. The plans for the handling of the other species have not yet been matured and they will not be considered here. Some spruce is found growing everywhere, but the conditions under which it is usually found resolve themselves into several more or less distinct types. The main watersheds are usually high and flat with a deep, rich, well drained soil admirably adapted for a hardwood growth. It is here that the hardwoods flourish but usually with a scattering intermixture of red spruce and fir. Under such conditions spruce grows well with a long clean bole, but owing to its scattering manner of growth is sometimes expensive to handle.

On areas bordering streams which rise gradually and extend back in some cases several miles, red spruce finds its home. Here it reaches its best development both in regard to quantity and quality. The soil consists usually of a sandy loam, deep and fairly well drained. Red spruce again is found growing in absolutely pure stands on steep mountain slopes bordering deep ravines.

Black or barren spruce is encountered on flat, poorly drained soils surrounding barrens at the headwaters of streams. On such ground black spruce is found in absolutely pure stands and on slight elevations throughout the barren it will reach its best development. This tree has a very slow scrubby habit of growth, and at its best seldom reaches sawlog size. Black spruce, however, makes the heaviest and best pulp.

Spruce is utilized for deal but mainly for pulpwood and it is this fact that makes the practice of conservative lumbering particularly applicable. The policy of the company is two-fold: to utilize all the wood available, i.e. to waste nothing of commercial value, and to ensure a rotation of wood crops in perpetuity.

It is true that one trained in the German schools might see in our innovations only the crude beginnings of what we would regard as a forest policy, but when one considers the great difficulties to be contended with it seems doubtful whether at least just now any more advanced system could be introduced and carried through to a successful result. Low stumpage values, untrained help and, above all, the grave danger from fire preclude any but the simplest and cheapest methods. However, what changes have been introduced have proved very effective and are paving the way for more aggressive work later on. A great deal of timber that would under the usual conditions of logging be lost has been saved while a future crop on cut over lands is insured within a comparatively few years. More radical changes will be introduced as the time ripens for them and as the conditions seem to indicate their feasibility.

Take, for example, the question of forest tree weeds. No active policy looking to their destruction has as yet been inaugurated, but plans are now being considered to griddle and destroy the more aggressive of these wolves and to replace them with valuable species. In a year or two this work will have become an annual tax on the company.

It may be stated that the logging operations are carried on mainly by jobbers, cutting and hauling by the thousand, though there is usually one company camp at each operating centre. The various changes in the woods work which we have inaugurated and have carried through to a successful issue will now be considered.

Under the old system of logging in vogue here for many years it was the custom to take only the most available trees. Roads were run into the thick bunches under a process that 'skinned off' all the cheap logs and when these were taken a camp was located elsewhere and more cheap logs were obtained. Anyone traveling through a piece of woodland cut a few years ago is at once struck with the strips of mature trees lying between the roads and at slightly more than a twitching distance from them. Also on rough ground and elsewhere bunches of mature timber are found overlooked or neglected in the reckless and hap-hazard methods which culled only the cheapest logs. Cruising was left almost wholly to the jobber and so long as he got out a sufficient quantity of cheap logs each year the operator seldom questioned his methods. To overcome this extravagance this company has instituted a system of blocking the ground into square miles. About 50 miles are blocked in this way each year and the lines dividing the blocks are kept well spotted up. Each block is cruised by a competent man. He estimates the quantity of timber on the block, gets some idea of the topography of the ground, decides how the logs are to be hauled and fixes the approximate cost of obtaining them. Careful field notes are made and preserved in a ledger for the purpose. The cruiser in locating a camp decides what blocks are to be cut from it and in what order they are to be taken. The block lines of course do not always confine the jobber. His work is necessarily governed by the topography of the ground, but the lines enable the forester to control the jobber as the work progresses in a way that could not otherwise be done. The jobber is confined to a certain area each year either within natural or artificial boundaries and this he must cut clean before he is allowed to go further afield.

A future crop is provided for by cutting down to a diameter limit of about 14 inches breast high. This may be a very crude method but it seems to be the only practical one under existing conditions. Whatever may be said against it there are at least some indisputable points in its favor. It is practicable, it leaves a flourishing young growth on the ground after cutting, and it ensures a splendid regeneration; for trees of the size indicated are quite capable of bearing a heavy seed crop and therefore of restocking the ground. With a few exceptions this diameter limit is rigidly adhered to everywhere in handling red and white spruce. The exceptions indicated are controlled by the following considerations. Trees under a diameter of 14 inches breast high are cut: Firstly, when there would otherwise be a blow-down; secondly, on barren ground, where the trees never reach a large size, and thirdly, in a burn.

Chief among those places where a blowdown is a practical certainty after an inroad is once made is the steep hillside. Here as a rule the soil is shallow; the spruce flatrooted and growing in almost pure stands. Unless a clean sweep of such an area is made a blowdown is inevitable, and it is therefore to everyone's interest that all trees of any commercial value whatever be taken. Logging, moreover, under such conditions is very expensive, and it requires all the return possible to make the operation pay. Regeneration is provided for by the existing seedling growth, which is usually very heavy.

Very similar considerations control an operation in barren spruce. Trees of sawlog size are seldom found, so that unless smaller trees are taken no operation is possible. Moreover, the barren spruce is a flat-rooted tree growing on wet, springy ground. When the protection of its neighbors is withdrawn it sways back and forth in the wind until the fine fibres of its root system stretch and break and it dies a premature death for want of sustenance. In these cases and in that of fire this company takes every tree that will measure 8 inches breast high.

In September, 1906, a fire burned over 4,000 acres of timber lands held by the Miramichi Lumber Company under lease from the provincial government. A very few years ago such a disaster would have been a total loss to the country and to the operator. The company was wholly unprepared for work in that locality at the time, but rather than lose the material it went to the expense of an operation. The result is that 6,000,000 feet of timber that would otherwise have been a total loss have been saved.

All trees are sawn down. The use of the crosscut saw is an innova-

tion which at first met with little favor among the rank and file of Miramichi woodsmen. Many difficulties had to be overcome before its use became universal among the jobbers. Now, however, all our lumber is handled with saws, and as the men become better trained to its use more pieces are being obtained to the yard crew per day than was the case with axes. The company insisted on the use of saws for two reasons. Much lower stumps can be cut and the axe scarf is saved.

The question of low stumps is the source of considerable friction in the camps. No attention whatever having ever been paid before to this matter, the men hardly appreciate the value of the material saved, and regard only the additional work they are called upon to do. The company insists on all trees being cut at the point where the tree bole begins to swell into the knee or root. Below that the additional length of the log does not compensate for the extra work involved; while above that point there is a loss of valuable timber. Constant supervision of the work has yielded most gratifying results, however, and it is estimated that this fall three-sixths more timber has been obtained out of each tree through the low sawing of stumps.

Pursuing the policy of wasting nothing of commercial value, the tops of all trees are cleaned up to and sawn off where the diameter measures about 5 or 6 inches. Whenever the top is sound this is always insisted upon, no matter how heavy the swamping may be. Here again considerable opposition was encountered in the beginning. In the jobber's opinion there was a great deal of work to be done to obtain a very small log. Pulpwood has reached such a value, however, that it pays to take these rough tops, and moreover, the smaller the top left in the woods the sooner will it disintegrate and become fireproof and thus restrict the spread of fire. The opposition has gradually yielded to persuasion and insistence until now very few tops are left. An exhibition of the care exercised by this company in pursuing its policy of saving everything of any commercial value whatever is afforded in the following incident: Some limits were acquired last summer from an operator who handled nothing but 10 inch sawlogs; the tops of the trees being left in the woods to rot. We have put in camps this fall, some of which will do little else but swamp out and yard these tops, which will be taken for pulpwood. Such an operation has probably never before been undertaken in this province, and affords a good sample of the ideas that control our policy.

Wherever other species are available no young spruce are allowed to be cut for skids, but whenever they are cut they are taken and marked for pulpwood. Jobbers are under contract to take all seamy and unsound trees with the idea of eventually freeing the forest of moribunds.

War is not being waged to any extent on forest weeds, since such proceedings entail more expense than present stumpage values seem to justify, but here again jobbers are encouraged to use tree weeds, such as fire and sound spruce, for building purposes and so forth wherever possible. The machinery for enforcing these regulations is very simple, but has proved quite effective. The jobbers all sign written contracts, wherein all the detail of the regulations that control their operation is set forth. The company reserves the right to charge the jobber stumpage for all timber wasted, and further to take the contract out of his hands if in the opinion of competent men the work is wholly unsatisfactory. So far it has not been found necessary to exercise this prerogative. A sufficient number of trained men are employed who spend the winter in the camps, keep constantly in touch with the jobbers, help them in their cruising and check them up where necessary. The work of these men is largely educative, and has been attended with splendid results. The jobbers with very few exceptions have displayed a readiness to take hold of new ideas and help out the company in its policy, which has been very gratifying.

The fire problem is one to which naturally a great deal of attention has been given. Without adequate government co-operation, however, no private system, however elaborate, can be considered effective. We have fire wardens during the summer months stationed at each of our chief operating centres. These centres are connected by telephone with the central office, so that in case of fire details can be transmitted to the settlement with the least possible delay. It is the duty of the fire warden:—

(1) To patrol the area under his charge and to constantly visit lookout stations on the mountain tops.

(2) To follow up hunting and fishing parties, identify them and caution them in regard to fires.

(3) To see that fire notices are properly posted in prominent places and to transmit word immediately to the settlement in case of fire.

It is doubtful whether any system of burning the tops or of lopping off their boughs can be made to pay in a spruce forest, but the necessity for this is largely obviated by taking all trees to 5 or 6 inches diameter. The top left is comparatively small, lies close to the ground and soon disintegrates.

A large acreage of the company's holdings consists of burned-over land. Some of this is coming up in a second growth of spruce, but the bulk of it must be regarded as waste land. It represents capital which is tied up and drawing no return whatever. The only possible solution lies in planting up, and whether that will pay or not is a problem for the near future. One point, however, is quite clear: the leases of timber limits held under the Crown must be guaranteed in perpetuity before any policy of restocking waste government lands can be considered by private operators.

PASSING OF A WELL KNOWN LUMBERMAN.

By the death of William Thackray, of the firm of Thackray & Sproule, which occurred unexpectedly on December 20th at his late residence Buena Vista Road, Rockcliffe, Ottawa has lost one of its most prominent and esteemed business men. About a week prior to his death Mr. Thackray was confined to his bed with erysipelas, which speedily developed into heart failure.

The late Mr. Thackray was the son of Robert Thackray, for many years a well-to-do manufacturer of sashes, doors and blinds. Born in

THE LATE WILLIAM THACKRAY.

1864, he was educated in the Ottawa public schools, and upon leaving entered the Vulcan Iron Foundry under Mr. Alex. Fleck. Upon completing his apprenticeship as machinist, he entered into partnership with his father and step-brothers, ex-Ald. R. J. Davidson and Ald. James Davidson. This ultimately became the firm of Davidson & Thackray, and upon its dissolution the deceased entered partnership with Mr. R. A. Sproule in the manufacture of office fittings.

Socially the late Mr. Thackray was unusually well known and counted as his friends many of the most influential men in the city. He was of a genial disposition and his untimely death came as a great shock to the community. He was connected with several fraternal organizations, including the Free Masons, I.O.F., and Elks Club. At the First Congregational church, of which he was a member, he was a regular attendant.

Besides his widow, there survive Lieut. R. G. Thackray, Miss Fay Thackray and five other children; Mrs. J. E. Hume, a sister, and Ald. James Davidson and ex-Ald. Davidson, step-brothers.

THE EXPORT OF PULPWOOD*

In considering the very important question of prohibiting the export of pulpwood and saw logs, many seem to forget, or not to know, that Canada has the most of the best green trees on earth, and that our magnificent heritage of evergreen, spruce and pine trees provides a crop that only requires careful handling on our part to be a permanent source of incalculable wealth to the country; and that especially with reference to pulpwood, Canadian spruce makes the strongest, longest, and most fibrous and feathery wood pulp obtainable anywhere, far superior to that of Scandinavia, Russia, Austria, Finland, or to what remains in the United States. Canada has over 2,600,000 square miles (over 1,650,000,000 acres) of green timber, very largely spruce and pine, although there is besides a great deal of hardwood.

Canada's area of pulpwood is much more the envy of the United States than it is—as it should be—the pride of Canada. This is made clear when we realize that out of 70,000 square miles of timber lands under license in the the Province of Quebec alone, the Yankees own nearly 15,000; therefore, as 15 is to 70, so is the position of these mercantile marauders to the south of us with respect to Quebec timber lands.

And unless we prohibit exportation of pulpwood from Canada, this ratio will increase year by year. In the last quarter of a century, I have seen it grow from practically nothing to its present alarming proportions, and those who come after me will find it worse for Canada and its paper industry, unless a stop is put to this marauding.

While pulpwood is a raw material of comparatively low value, it produces manufactured articles of high cost.

Millions upon millions of spruce logs, hundreds of thousands of cords of pulpwood, from Quebec, Ontario, Nova Scotia and New Brunswick, go annually to feed the pulp and paper mills of the Eastern, Middle and Western States; Canada gets but little out of this; the Government do not get one dollar a cord for the standing wood; the chopper, the loader and the teamster not much more, and the railways only a low rate on coarse freight; so that in all not over \$6 to \$7 a cord is left in Canada on an average, for the hundreds of thousands of cords of pulpwood taken out of our country annually.

Grind this wood into pulp and watch the disbursements for wages, and freight grow; every cord of wood made into pulp will realize about \$20; when made into fibre, about \$30 to \$32; when made into paper, \$40 to \$45 and upwards. The pulp and paper industry gives more healthy, steady, day and night employment to a larger number of men, women and children, at higher wages, all the year round, than any other industry in Canada.

Has Canada anything to fear from the United States about this? Can they retaliate? Will they? No, they got about all they could stand of that sort of medicine when the Dingley Tariff on eggs, aroused the great Canadian hen. President Roosevelt's big stick has no retaliation knobs on it just now with which to whack Canadian wood pulp. The President and the press of the United States urge, let me repeat, urge, the repeal of the United States import duty on pulpwood, wood pulp, and white news paper, and are now suggesting, nay may soon be suing for and begging for an agreement with Canada to try and prevent the Canadian Government from imposing an export duty on pulpwood or from prohibiting the exportation of our wood and logs. But we must not permit our country and its forest products to be further devastated by these marauders; let them come over here and establish pulp and paper mills; just as the Eddys, the Baldwins, the Millens, the Bronsons, the Youngs, the Westons, the Hughsons and others came here and established sawmills. They are welcome to Canada. I would like to see Hull "the Holyoke of Canada," just as much as the Prime Minister will be glad to see Ottawa "the Washington of the North," and in this will stand shoulder to shoulder with Sir Wilfrid Laurier or any other man who will do these two great things for Canada. Remember what happened throughout the Georgian Bay district when the Ontario Government restricted the export of sawlogs into Michigan, Wisconsin and other Western States, sawmills sprang up by the dozens, factories

started by the score. If all our wood was kept at home to be turned into pulp and paper in Canada, the result in ten years would surpass the expectations of the most sanguine of us, while the result in twenty years would be almost beyond present imagination and dreams.

THE UNITED STATES VIEW POINT.

The leading pulp and paper trade journal of the United States asked the United States pulp and paper makers the other day whether they were in favor of, or opposed to, the recommendation of President Roosevelt to repeal the duty on pulp and paper going into the United States.

Mr. N. W. Jones, manager of the Katahdin Pulp & Paper Company, Lincoln, Maine, says:—

"The annual production of pulp in the United States November 1st, 1906 is: Sulphite, 1,235,832 tons; ground wood, 1,736,216 tons; soda pulp, 327,600 tons; total, 3,300,48 tons. The annual production of pulp in Canada is: Sulphite, 172,224 tons; ground wood, 550,368 tons; soda pulp, 10,920 tons; total, 733,512 tons"; thus showing that Canada is producing only about one-fifth as much pulp as is produced in this country.

Mr. Jones also adds that if United States manufacturers were obtaining their entire supply of wood from lands wholly in the United States they would be using up the States territory nearly six times as fast as Canada is using up hers, but fortunately for them, a large proportion of the pulpwood used by them is obtained from Canada, hence they are getting the benefit of our timber, and so on.

Mr. Geo. W. Sissons, president of the Racquette River Paper Company, United States, says:—

"I am a staunch protectionist from the period of Henry Clay. The Canadian Government and certain Canadian interests are agitating for such legislation there as will reduce the exportation of their pulpwood and compel its manufacture into paper by their own labor in Canada, and then to sell to us the finished product. I believe in protecting our own labor and industries, and am opposed to any present tariff revision, as a general proposition or as a special favor to interests which have it in their own power to protect themselves. The real prosperity of the varied interests of our country in which all classes participate, and never before to such pronounced or general extent, is the strongest argument against unsettling such conditions through any uncertainty as to the extent of tariff revision if attempted at all."

Other answers are:—"Cannot see how it will do the mills any harm, or the consumers any good. It will simply build up the industry of Canada. Do not think their industry can be singled out for tariff revision. Must go down the line.

"Would be opposed to the duty being removed on pulp or paper. While it would make no difference in the line we manufacture, it would be a very serious matter for the print mills of this country.

"If we read the signs of the times correctly, the moment the duty was taken off the commodities referred to Canada would immediately put on an export duty much heavier than the duty now levied by the United States.

"Would not object to reduction of tariff duty on pulp and paper, providing arrangements were made with Canadian Government to allow Canadian pulpwood to come into the United States without export duty, and on same basis on which Canadian mills receive their wood supply.

"Satisfactory if Canadians remove their wood restrictions; otherwise free trade with Canada.

"We are most emphatically in favor of repeal of all duty on wood pulp. The duty must be taken off pulp, and the sooner it is done the better it will be for every paper mill and consumer, as also for the preservation of our own forests."

We are not opposed to the repeal of the duties, provided an arrangement can be made whereby Canada will permit the exportation of pulpwood without export duty. The supply of pulpwood, as you well know, is very important for the paper making interest of this country; and if we let the bars down on paper and pulp from Canada, we should have some guarantee that their pulp wood can come into this country free, so long as the pulp and paper does. Such an arrangement in our opinion would work no detriment to the American paper manufacturer; and we think with free wood we can stay in the game as long as the Canadian paper manufacturers. We have thought for some time that wood pulp and sulphite pulp should come in free, but have not been quite clear on

*Address by W. H. Rowley, of the E. B. Eddy Company, before the Canadian Manufacturers' Association Executive, December 5, 1907.

the paper question. If paper manufacturers can be assured of free pulpwood, in our judgment there would be no objection to the repeal of duty on paper from Canada.

"Aside from any recommendation by the President, we believe it would be wise to take off the duty from all woodpulp, both mechanical and chemical; also believe in lowering the duty on paper say 20 per cent., which would afford a reasonable measure of protection.

"If Canada will take her duties off we would be glad to have duty off our own country.

"In Canada there is a widespread demand that the Canadian Parliament should enact an export duty on pulp logs. The American papermaker is not getting raw material from Canada, because his field of supply is exhausted. If such an export duty was imposed there it would merely mean that the cutting in American forests would be increased. The imposition of an export duty on pulpwood on Canada's part would mean probably that American capital would cross the border and build up mills there, thus distributing its money through payrolls in the Dominion rather than in the United States. This would not be a step of benefit to our own country and its people, I believe." And so on.

These are the opinions of the manufacturers across the line whose interests are vitally affected. The conclusions are obvious.

TRANSPORTATION PROBLEM.

Passing from the subject of pulp and paper, to a discussion of transportation, Mr. Rowley said in part:—

"The great problem of transportation on this continent, is the passing of the products of the West, that are all eastbound to the ocean. There is only one present practical solution for the relief of the congestion that has arisen and is increasing, and that is the construction of a waterway from the Great Lakes to the seaboard, that shall do away with the necessity of transferring freight at intermediate ports or points. Canada holds the key to the situation in the building of the Georgian Bay Canal. The economy of water transportation is no longer questioned, as it is now well known that the rate per ton per mile will thus be about one-sixth of the lowest present rate by rail.

"The Georgian Bay Canal route is 600 miles shorter than the present best (but circuitous) route, by the Welland and St. Lawrence canals; it is also well known that by the Georgian Bay canal route the time consumed will be only about 4 1-4 days or about 3 days less than are now consumed in the passage.

"The enormous magnitude of the commerce of the Great Lakes is represented by the vast tonnage that passes through the Soo Canal—over fifty-one million tons in 1906, which is over seven and a half million tons more than went through these canals in 1905. This traffic has doubled in the past six years. The lumber traffic, which amounts to over five and a half million tons, will at once be added to these large figures, when the Georgian Bay Canal is opened.

"Coal from Nova Scotia to the volume of one and a half million tons already comes annually to Montreal (some as far west as Ottawa), but with the Georgian Bay Canal, Nova Scotia coal can be laid down all along the route as far west and north as North Bay, thus pushing our coal supply 200 miles further north and west, and laying the coal down there as cheaply as United States coal is laid down at Toronto now.

"Thirty-five million tons of iron ore passed through the Soo Canals last year.

"Pulpwood, now shipped by rail from the Nipissing district at a cost of \$3 and up a cord, could be sent to the mills by the Georgian Bay Canal in vaster quantities at a much lower cost for freight.

"The stone and marble quarries near Portage du Fort and other points all along the proposed route of the Georgian Bay Canal only await development until the opening and operation of the canal.

"The cement industry, and this is the 'cement age,' will then develop all along the canal route in a way that now may look like a dream to some, but will be a paying and much more profitable enterprise when we get water transportation.

"Thus cheap waterways will give to Canada an open market to the world, a market of which we have so far only touched the edge and fringe, just as I have only touched the edge and border of the subjects about which you have been good enough to be interested in hearing from me for the past few minutes."

SAW MILLING IN CANADA.

Regarding saw milling in Canada a writer in the "Liverpool Daily Post and Mercury" has this to say:—

"At a rough estimate there are 1,000 saw mills in Ontario. We contented ourselves with the sight of one—a big concern at Blind River, in the district of Algoma; and so, having seen one of them, we consented to forgo the other 999 with perfectly cheerful resignation. Blind River was our sole object lesson in the lumber trade of Ontario. Of the romantic open air life of the woodsmen who fell trees in the forest, the teamsters who haul the logs to the waterside, and the famous drivers who float the logs down the flooded streams, we saw nothing, for the end of September is not the time of the year when these things are to be seen. But the operations at the saw mill served to show us the extent of the season's activities, and helped us to realize more effectively than stacks of statistics the enormous volume and value of the lumber industry in Northern Ontario. Huge piles of sawn timber were ranged for half a mile along the side of the river ready for shipment. Thousands of logs caught up in booms were lying in the river waiting their turn for the mill, and the mill itself was working furiously at its maximum capacity to get rid of the accumulation of lumber before the winter set in. No work which can be done by machinery is done by hand in an up-to-date saw mill such as this was and all others are in Ontario. From the moment the big logs enter the workshop at one end by way of the endless chain carrier, which hauls them up from the river, until they are slid out at the other end in the shape of planks of varying length and thickness, they are never once actually handled by the workmen. The men are concerned solely with the direction of the machinery which does the work for them. Finally, as the boards pass out, they are reviewed by an expert with a blue pencil, who makes marks on them which indicate their dimensions, and serve as directions to the men who are engaged in the piling. Add to all this the incessant screeching din of the whizzing saws, the jarring rattle of the engines, the whirring of the carriers, the vicious kicking of the "nigger," and the thud of the plunging logs, and you will have as faithful an impression of the interior of a Canadian sawmill as I am able to give you. And when you consider that this mill, like all its thousand fellows, works day and night without a break, throughout the summer, you will begin to appreciate what a big part the lumber trade plays in the industrial life of Ontario. In the light of the estimates I have mentioned, it cannot be denied that in its timber trade, positive and potential, Ontario possesses a prodigious golden egg; nor can it be denied that the Government has shown sufficient foresight in the adoption of means to prevent the killing of the goose. To conserve the riches of the forrest, four vast tracks—Temagami (in the Nipissing district), Mississauga (Algoma), Nipigon (Thunder Bay district), and the Eastern Frontenac County—have been permanently withdrawn from settlement and set apart as forest reserves. These territories have a combined area of 16,300 square miles—almost equal to that of the land at present under license—and their pine wealth is estimated at seven million feet. To protect them from the dangers of fire and depredators, a big army of forest rangers has to be maintained. In this direction, useful employment is found for the forest wisdom of the Indians, who take the more kindly to the duties of policemen inasmuch as their freedom to hunt during the winter is not interfered with."

THE PETERBORO TENT & AWNING COMPANY

J. J. Turner & Sons, tent and awning manufacturers of Peterboro, Ont., who claim to be the largest and oldest firm in Canada in their particular line, started in business nearly forty years ago in Port Hope. Moving to Peterboro twenty-one years ago, they laid the foundation of their present large and expanding trade. They manufacture almost everything required by lumbermen, contractors, surveyors, prospectors and campers. They are also large manufacturers of flags and are at the present time making flags for all the schools of Ontario. This firm also exhibited this year at the Canadian National Exhibition, at Toronto, the largest Union Jack ever made or hoisted in Canada, having for the last three years received the first price for their exhibit. They are also sole manufacturers in Canada for the "Walsh Window Tent for Consumptives," which is said to be the finest thing ever invented for the purpose.

ANNUAL REPORT OF U. S. FOREST SERVICE.

The report of the lumber cut of 1906, compiled by the United States Forest Service, has just been made public and forms the second attempt by the American Government to furnish the annual statistics of the lumber trade. The first attempt was made last year, and was on the cut for 1905. Reports from only 11,666 lumber manufacturers were secured, and the figures, while of great interest and value, were too incomplete to afford more than an approximate comparison with the only data existing, the census reports of 1899 and 1904.

This year the compilation of the cut, for the year 1906, is made up from reports from 22,398 mills, a very large percentage of which reported direct on schedule blanks prepared by the Census Bureau and the Forest Service acting in conjunction.

The report shows the total production for 1906 to have been 37,550,736,000 feet, as against 34,787,084,000 feet for 1899, or an increase of 7.9 per cent. No claim is made that the figures are exactly correct, but it is claimed that the mills not reporting are small and relatively unimportant, and probably ten per cent. additional will be a fair allowance to cover their production. This gives a total of approximately 40,000,000,000 feet.

The mill value of the product reported is placed at \$721,151,388, by far the largest sum ever given for a single year. In addition, shingles and lath to the value of \$35,645,125 were produced, giving a total value for these three forms of forest product for 1906 of \$656,796,513.

Softwoods make up 30,235,245,000 feet of the production, and hardwoods 7,315,491,000 feet, an increase of about 4,000,000,000 feet for softwood and a decrease of more than 1,000,000,000 for hardwoods, as compared with 1899.

Yellow pine is far ahead of all other woods, with a production of more than 11,500,000,000 feet, an increase of 20.7 per cent. over 1899, and constituting nearly a third (31.1 per cent.) of the total cut. Douglas fir comes next, with nearly 5,000,000,000 feet, an increase of 182.2 per cent. over 1899 (the largest gain of any wood), and making up 13.2 per cent of the whole. White pine (including Norway pine), though showing a decrease of 40.8 per cent, is in third place, and makes 12.2 per cent of the whole. Oak and poplar show heavy declines, 36.4 per cent. and 38.7 per cent., respectively, though oak holds fifth place in percentage of total cut, 75.5 per cent. All the other woods show increases except cottonwood, elm and ash, which have declined 36.4 per cent, 50.8 per cent., and 20.3 per cent., respectively. Cypress shows an increase of 69.3 per cent.; red gum, 59 per cent.; and birch, 179.3 per cent.

Washington leads all other States, with a cut of over four billion feet, Louisiana coming second, with nearly three billion feet, Wisconsin and Michigan are nearly equal with a little more than two billion each, and Mississippi and Arkansas close together with a little less than two billion each. The big relative increases have been in the West and on the Pacific coast, Idaho having cut more than six times as much lumber as in 1899, Washington three times as much, and Oregon more than double. Louisiana shows an increase of 151 per cent., and Mississippi 53 per cent. Arkansas, Texas, Virginia, West Virginia, Florida and South Carolina all show increases, the largest being 41.5 per cent. for Texas, 26.2 per cent. for West Virginia, and 21.6 per cent. for South Carolina. All the other Southern States show decreases, 7.9 per cent for Alabama, 36.4 per cent. for Georgia, two pine states; and 23.4 per cent for Kentucky and 32.5 per cent for Tennessee, two hardwood states.

It will be seen that production in these two last named states—two of the best wooded hardwood states in the South—has fallen off in a period of seven years, one-fourth in the one, and nearly a third in the other. In view of the urgent demand and the high prices of hardwoods during the whole of this period, it is difficult to see how anything could show in a more striking manner the rapid waning of the hardwood timber supply.

The total value of the lumber cut of 1906, being given at \$621,151,388, shows an average mill price of \$16.60 per thousand feet. One of the most interesting tabulations in the report is the one giving the comparative average prices on the different woods for 1899, 1904 and 1906. Yellow pine shows an advance of from \$8.48 in 1899, to \$15.02 in 1906, or 77 per cent., the greatest increase shown by any wood except tamarac, a relatively unimportant species, which came up from \$8.73 to \$15.63, or 80 per cent. Poplar shows increase in price of 73 per cent.; cypress, 64 per cent.; and oak, 59 per cent. Red gum has increased 40 per cent.; cottonwood, 65 per cent.; walnut, the highest priced of Ameri-

can woods used in any considerable volume, shows the smallest rise in price, \$42.25, as against 36.49 in 1899, or 16 per cent.

In addition to the lumber, shingle and lath production, the report takes up stumpage values, and gives prices based on many hundreds of quotations on each important wood. To many this will prove the most interesting portion of the report. It puts white pine at the head of the list, with a stumpage value of \$8.09 per thousand, and Douglas fir at the lowest, \$1.44.

DRY ROT IN TIMBER.

Some progress has been made in recent years in the application of scientific knowledge to the prevention of the decay of building materials, but the destruction of timber attacked by dry rot still continues to be a frequent source of trouble to builders and householders. It has long been known that dry rot is caused by the growth upon the timber of a fungus known as *merulius lachrymans*, that the fungus is propagated by spores, and that (though oddly called "dry" rot) it can live only in the presence of moisture; but further information is required to enable infected timber to be detected before it has suffered any damage. One feature of good timber is that it emits a sonorous sound when struck, but if the timber is in such a bad condition that, when struck, it emits a dull sound, that timber is already unfit for use.

The fungus which is responsible for the appearance of dry rot in timber, emanates from a spore which has been deposited upon the timber, but only when the timber is moist and surrounded by stagnant air can the spore develop into a flourishing fungus. The healthiest fungi grow upon timber exposed to a warm, damp atmosphere, in a situation free from draughts.

The appearance of the fungus varies with the conditions under which it grows, but it usually assumes the form of a soft web of white, yellow or brown color spread over the surface of the timber. Its growth is accompanied by the emission of a musty odor. When the growth is allowed to proceed unchecked the timber is gradually converted into a mass which can easily be crumbled to powder in the hands, and the web-like fungus is seen in the interior of the wood as well as on the surface. During the process of the decomposition of the wood carbon dioxide, water, and other more complex gases are produced. When a spore has commenced to grow upon the timber the fungus which is developed from it speedily reaches a sufficiently mature state to throw off from itself numerous spores, which in turn develop into fungi, if the timber continues in condition suitable for fungi growth.

The fungus cannot live without water, and dry timber exposed in a dry atmosphere cannot, therefore, be attacked by dry rot. The spread of dry rot in timber may be due to some defect in the timber itself, or to the exposure of good timber to conditions favorable to the growth of the dry rot fungus. If the timber has not been properly seasoned, and contains, therefore, a considerable quantity of sap, the speedy appearance of dry rot may be expected. Unseasoned timber, stacked in such a way that fresh air cannot play freely around it, is very liable to be attacked. Timber which has been varnished or painted before it has been sufficiently seasoned is also prone to attack, because it is kept always in a moist condition, owing to the water of the sap being imprisoned by the water-proof coat of paint or varnish.

The most common cause of the development of dry rot in houses is the construction of a kitchen floor over damp earth, or over a moist concrete foundation, and the covering of the upper surface of the floor with linoleum or other material which prevents access of fresh air to the surface of the timber. Timber so treated is exposed to all the most favorable conditions for the rapid growth of the fungus, viz.:—(1) Presence of moisture; (2) warmth; and (3) exposure in stagnant air. It is worthy of note that although moisture is essential to the fungus growth, yet timber kept under water appears to be immune from dry rot.

It should be remembered that most of the conditions which favor the growth of the dry fungus are inimical to human life, and the appearance of the fungus upon the walls or floor of a dwelling room should, therefore, be accepted as evidence that the atmosphere in the neighborhood of the fungus is stagnant and damp, and liable to injuriously affect persons exposed to its influence. Fresh air and sunlight, which are so beneficial to animal life, will destroy dry rot fungi in a few hours.

PATENT ROOFINGS AND THE SHINGLE TRADE.

It is certain that the difficulties which have confronted the manufacturers of west coast shingles during the past year or two have been taken advantage of by the manufacturers of patent roofings. During Pacific coast has made it practically impossible to guarantee anything the past year especially, when the car situation on lines from the north like prompt delivery on shingles, the builders of the cheaper class of buildings have turned to the prepared roofings as substitutes. The high prices of shingles have also had more or less to do with the increased demand for patent roofings for a class of buildings where utility rather than appearance was the first consideration. Without claiming any special ornamentation for a shingle roof, a roof covered with patent roofing lays no particular claim to beauty. It will be much more difficult to get shingles, and they will be much higher in price, when patent roofings take their place on the dwelling of average cost or above, but at the same time it is pretty well established that for places where low grade shingles have been used, there are many patent roofings which are more serviceable and more durable.

Over a considerable portion of the country the red cedar shingle from the north Pacific coast states has driven out almost all shingles manufactured from other woods. Redwood shingles from California and cypress shingles from the extreme South are practically the only competitors of the red cedar, excepting in a comparatively limited area where the white cedar shingles of Wisconsin and Michigan are sold. While there is still remaining an immense amount of red cedar timber, in Washington and Oregon, and also across the line in British Columbia, it is a recognized fact that the timber available for the manufacture of shingles is not inexhaustible. The comparatively small cost of a plant where shingles can be manufactured and the good profits that have frequently been made in manufacturing them has attracted into the business greater productive capacity than there is any need for. Climatic conditions in the North Pacific Coast States are such that shingle mills can run the year round, and if the shingle mills now built were to run to their capacity the entire year the country would be surfeited with shingles, and prices could not be maintained at a living profit. For a number of years many efforts on the part of the leading manufacturers to curtail operations for a reasonable length of time have failed because of the cupidity of a few manufacturers who always took advantage of the idleness of competitors to keep their plants operating. This has kept the shingle market in an unsatisfactory condition except at such times as the railroads were unable to handle the business offered them, and those conditions could not be taken advantage of because of the difficulty of making deliveries.

Meanwhile the patent roofing industry has been as prolific as the shingle industry. The success of the first manufacturers has attracted into the business a very large number of others, and as the demand had to be created to a very considerable extent, at times, the inducement of price has been necessary to make the business a success for some of the later comers. Too often the result has been accomplished by a cheapening of the product, and though the roof may make a good appearance when it is put on, and may wear well for a time, rapid or great changes in temperature, or continued wear, develop the fact that the materials used in its manufacture are of the poorest. Patent roofings of this character will give a black eye to the patent roofing industry just as careless cement construction will place the seal of condemnation on work of that kind. Dealers who are seeking to take advantage of the present opportunities offered for the sale of patent roofings, would do well to make sure of the quality of the brands which they can recommend, and if their customers demand a less expensive grade they must sell it with the distinct understanding that they can not and do not recommend it. The quality of a shingle can be seen at a glance, but the quality of a patent roofing or a cement block can only be discovered by use, and absolute protection can only be assured when they are backed up by the definite guarantee of the manufacture.

Two possible good effects on the shingle manufacturing business may result from this rapid growth in the manufacture of patent roofings. One is that it will bring the owners of red cedar timber to the realization of the fact that their timber is of greater value than they have fully appreciated, and that they have been cutting it down too rapidly. There will always be a demand for good shingles at good prices, and the futility of sacrificing it in the uncertain market of the present must be

come apparent. The other effect on the shingle market will be indirect, but none the less beneficial. The use of poor grades of patent roofings whose inferior quality is exposed after a short period of use, will turn the attention back to the lasting quality of good shingles. While there are a number of patent roofings of excellent quality, a good shingle roof will outlast a roof of the great majority of the prepared roofings now on the market.—The "Mississippi Valley Lumberman."

THE PRESERVATIVE TREATMENT AND STAINING OF SHINGLES.

The preservative treatment of dry shingles is easily accomplished by immersing them for about one hour in a tank of creosote (dead oil of coal tar), heated to a temperature of about 212 degrees F. In case of damp or green shingles, it is often necessary to prolong this period in the hot oil. If, at the end of the hot bath, it is found that the oil has not thoroughly penetrated the wood, the heat may be shut off and the shingles allowed to remain in the cooling oil for an hour or more; or else they may be removed from the hot oil and quickly plunged into a cooler bath of the preservative, preferably at about 110 degrees F.

Staining of the shingles can also be accomplished in the same process. Any of the common colors can be used. They should be purchased ground in oil, not dry. Of the reds or browns, about one-half pound is required for each gallon of creosote. For greens or blues, this quantity should be increased. The color should be mixed with an equal quantity of boiled linseed oil and then stirred thoroughly into the creosote, at a temperature of about 110 degrees F.

The shingles should be immersed in the bath of hot creosote (112 degrees F.). If they are thoroughly seasoned, one-half hour in the hot oil will be sufficient. They should then be plunged in the cooler creosote and color and allowed to remain for about two hours. In this bath the shingles must be loose in order to permit an even deposit of the stain. A screen or lattice-work frame will assist in keeping the shingles under the oil. As a final step, the shingles should be spread out to dry.

If no suitable iron vats are available, the treatment tanks may be constructed by a boiler-maker, or sheet-iron worker. The hot tank need be only large enough for the immersion of a single bundle of shingles, unless it is desired to use it for the treatment of fence-posts or other timbers. If the heat must be applied by direct fire underneath, the metal should be heavy enough to withstand the flame—3-16-inch black iron, with the joints riveted and caulked. If steam coils can be used, the tank may be of fairly light galvanized iron, the joints being riveted and soldered. The tank for the cool oil can be made of light galvanized iron.

The cost of the treatment depends principally upon the local price of creosote and the quantity of shingles which it is desired to treat. If the process is properly carried out, however, the cost of a creosoted low grade shingle should not exceed the first cost of a high grade shingle of the same kind, nor should the cost of creosote and staining exceed that of thorough painting; and it is believed that the results are more desirable in every way.

PULP AND PAPER EXPORTS DECREASING.

Mr. Suntrum, commercial agent in Norway and Sweden, in a report to the Department of Trade and Commerce at Ottawa, gives figures to show that the exports of wood pulp are decreasing. A considerable rise has taken place in the price of pulp logs lately. Paper prices have responded to the advance and there is some evidence of a combination on the part of makers to keep up the price.

HANCOCK BROS. DISSOLVE PARTNERSHIP.

The firm of Hancock Bros., North Toronto, have dissolved partnership and henceforth the business will be conducted by Mr. T. H. Hancock, one of the members of the old firm. To a business which has steadily grown since its establishment little more than five years ago Mr. Hancock brings a fund of experience and native enterprise that augur well for the future. Already a very complete planing mill plant is catering to the needs of North Toronto, and prospects point to increased capacity and efficiency during the coming season.

MARKET CORRESPONDENCE

OTTAWA VALLEY LETTER.

Ottawa, Dec. 24, 1907.—The lumbermen of the Ottawa Valley are experiencing a quiet period. The extra work in connection with closing down the mills is pretty well over and the operations in the shanties are going on according to the curtailed plan arranged early in the season. Local trade is affected only in its volume by the scarcity of money. The lumbermen are not following the example of other Ottawa merchants who create brisk business by offering cheap bargains. There is a general firmness in the prices of the market all round. The large lumber firms expect to meet the British buyers about the middle of January, and there is no indication that their terms will moderate from last year.

Next week J. R. Booth will begin to bring logs by train from his Madawaska limits. It is the intention to haul about the same quantity as last year, unloading the logs on the ice near the mill. Just now repairs are being made to the saw mill and when they are finished the usual winter sawing will be started. The loading of logs has been started in the Booth shanties and extra hands are required for the work except where log makers are taken from their jobs. Mr. Booth finds that although the city is crowded with the unemployed, good loaders cannot be secured at less than \$26 or \$27 per month.

The wages for shantymen are high, but are more favorable for the employer than early in the autumn when the rate was \$10 higher. The men hired at the big wages will continue to receive it during the winter, as they are all under contract. The only thing the lumbermen gain in their relation with these employees is that they are more agreeable to conditions and display less likelihood of leaving their jobs before spring.

Several employment agents of the city are looking for small gangs of loaders and teamsters and find it difficult to get them at \$26 per month, fare and expenses paid. The vast majority of idle men in the city are English immigrants who know nothing about shanty life and, while they would accept the wage offered, the lumbermen have to refuse them. In some cases where shantymen had been hired by the month at \$37, they quit when their wages were cut down to \$26. On the whole the lumbermen gain little by the change in the labor market.

A new channel has been blasted out at the site of the W. C. Edwards Company's mill, New Edinburgh. This will give the mill, which is to take the place of the one recently destroyed by fire, much better water power. In connection with the improvement a coffer dam is to be put in at the top of the Rideau Falls.

Mr. S. C. Tompson, wholesale sales manager of the W. C. Edwards Company, is of the opinion that lumber prices will be higher next spring than at the present time, and Mr. W. A. Cameron, of Cameron & Company, holds the same opinion. By that time it is believed that the manufacturers will have felt very keenly the high price of supplies and labor in the shanties.

The dealers expect that the medium grades which are now low in stock will be advanced more than any of the others.

The scheme proposed by the city council of constructing a dam across the Ottawa River at Britannia is abandoned for the present on account of the refusal of the Metropolitan Power Company to sell the city its water power franchise for \$175,000. The dam if constructed would be a serious impediment to driving logs on the stream.

ELECTRIC LOGGING RAILROAD.

A proposition to put in an electric logging railway is being considered by Tacoma investors, who recently bought some timber lands close to Vancouver. The lands are in the valley of Lynn creek, across the inlet from Vancouver, and a logging railway is necessary to bring the timber to the waterfront. As the dumping ground for the timber would be at the mouth of Lynn creek, where the British Columbia Electric Railway's transmission lines land, the electrifying of the line and use of an electric locomotive would be an easy matter. As a vast amount of valuable timber is on the land, even the cost of an electric road would be warranted, to get it out. So far as known this is the first electric logging road projected on the continent.

NEW BRUNSWICK LETTER.

St. John, N.B., Dec. 21, 1907.—As the end of the year approaches, comparison of the current prices in the lumber trade to-day and at this time last year, furnish some interesting facts. In the months that lie between, history has been made in the lumber business of this province and many changes of importance have taken place.

One of the most vital changes has taken place in the price of "English" spruce deals. At the beginning of 1907, a specification containing, say 50 per cent. of 7 and 8-inch, 35 per cent. 9-inch and the balance 11-inch and wider, could not be bought at St. John for less than \$14.50 per thousand feet, and it is doubtful if any offer less than \$15 would have resulted in a deal. To-day, for the same specification, it is improbable that any offer above \$12.50 would be accepted.

The slump took place early last spring. Conditions had been of such a favorable nature in the English market for some years that the eagerness of manufacturers and dealers to get as great a quantity as possible on the market resulted in heavy stocks at all the chief distributing centres in the United Kingdom. The faintest sign of resuscitation brought on eagerness to sell that was almost a panic and the slump naturally followed.

The English deal trade has as yet shown little signs of recovery. What 1908 will bring forth in this direction is purely conjecture, but with the manufacturers of Eastern Canada reducing their logging operations 50 per cent., and with the prospect of a late start at the mills next year, the glutted condition of the market promises to be speedily reduced and shipments during the coming year will no doubt be considerably below normal. At this time last year dutiable spruce lath was selling at from \$2.50 to \$2.75 per thousand, f.o.b., St. John.

A lack of stimulus in this line of trade has been quite conspicuous for some months past. To-day it is doubtful if lath would bring more than \$1.50 to \$1.60 per thousand at St. John. In fact there is little or no demand for this line of goods.

Spruce deals for export to the United States have been low in price and the demand has been slack all through the season. Prospects for this line of goods were very light during the first weeks of 1907, but expectations were not realized. To-day there is practically no demand for lumber in the Eastern States, owing to the financial stringency and its natural effect upon the building trade in general. Prices have suffered accordingly and what sales are made at present are effected by means of prosperity and extraordinarily high prices.

Regardless apparently of conditions of trade, of forecasts and probabilities, the New Brunswick cedar shingle has had a year of remarkable prosperity and extraordinarily high prices.

One year ago "Extras" were bringing in the vicinity of \$3.35 per thousand and "Clears" at \$2.85, delivered at Boston or vicinity. To-day the same lines are bringing \$4.25 and \$3.75, respectively, with few offering, stocks at both ends being very light.

THE SPRUCE FORESTS OF NOVA SCOTIA.

It is conceded by many of the largest lumber operators, that Nova Scotia possesses the largest growth of spruce forests in North America. From actual measurements it has been ascertained that an average growth of two inches in diameter is made every five years, owing probably to the genial and moist climate. A steady growth seems to go on perpetually from the time the young trees are a few inches to maturity, fixed at 100 to 150 years. Nova Scotia has reached its maximum cut of lumber. How long can this be maintained? Owing to absence of forest fires, fire protection laws and a radical change in the ideas and methods of timber land owners and operators, who now refuse to sell their stumpage, except under conditions of restricted cutting, and rapid growth of the spruce trees and better methods of lumbering operations, there is every reason to believe that the present cut of lumber in Nova Scotia can be maintained. With the increasing price of the product, the value of the export, a leading feature in the trade, will in all probability exceed in the future, what it is at the present time. It would be a good thing for Nova Scotia when the country to the west and south is devastated of its timber, to still have forests and a goodly supply of timber.—The American Lumberman.

THE Wood-Worker and Retailer

THIN SHOP SAWS.

We have been reading a great deal about thin band saws for ripping, but very little has been said about thin circular saws for this purpose, although the price of lumber has been going up. This in itself is enough to make this subject very interesting to the owner in a financial way, also from the point of power, etc. A thin saw certainly requires less power than a thick one, the reason being that it removes less material, i.e., smaller saw kerf. It is all very well to talk about thin saws and all that can be saved by them, but, again, if not properly cared for and used, they may be a source of annoyance and great expense instead of a saving.

I wish to call attention to the sketch marked Fig. 2. This is a properly proportioned rip saw. In the first place, never have the saw point more than 1 inch apart; less is better in most cases. I prefer points

against the saw. Fig. 3 shows the face of collar, and Fig. 1 shows all in pine, when the saw began to squeak and dodge every time it came in contact with a hard knot. There were two reasons for this. One was, the saw was not perfectly round and did not have good sharp points on the teeth; the other fault was, it was too weak in proportion to its diameter for rough-and-ready work. No matter how sharp a saw may be to start with, it will, in a comparatively short time, become dull; then, if there isn't something to offset this dullness to some extent, things will go wrong.

Here is the way I remedied the trouble, instead of using the 13 gauge which was substituted for the 16 gauge. A set of two collars, made of cast iron, about 3-8 inch thick, turned up true, was used, so as to press most on the outside edge. By viewing the section marked Fig. 4 it will be seen that the collar is turned tapering on the side to go up

FIG. 1.

FIG. 4.

FIG. 3.

FIG. 2.

3-4 inches apart. The depth of the tooth should in all cases be one-half the distance from point to point. Thus, if the points are 1 inch apart the tooth should be 1-2 inch long or deep. The slant or pitch of the front of the tooth should be what is known as one-fourth pitch. The line *a* is one-fourth the diameter, and, as will be noticed, the front of the tooth is, from its point to this line, a direct, straight line, as will be seen from the lines marked *b*. The back of the tooth is strongest, considering the cutting edge, when the dividers are set at somewhere between one-half to three-quarters of the diameter of the saw and its centre. Taken on the quarter pitch line, put the one leg on the point of the tooth and describe part of an arc. Your own judgment will tell you when you are correct.

A few words as to filing and setting these thin saws. Give them very little set, spring set or swage, it doesn't make much difference. I prefer spring set for the reason that it can be more accurately done without side filing. File the saw straight across on the inside or throat of the tooth and give very little bevel on the back, just enough to insure a good point, and you will have as nice a cutting saw as can be desired.

Thin saws are not hard to operate, as some seem to think. To prove this let me illustrate one instance, where a 16 gauge saw came with a self-feed rip saw. The machine was properly set up and all in readiness. The start was made; a few cuts were made in common rough Norway

place and ready for use. This is a very nice combination and a pleasure to operate. We use 16 gauge saws for all ordinary work, also for oak plank as thick as 3 inches. The saws stand up well to all the work that a 4 inch belt can pull.

When we wish to get many pieces out of a certain piece and create a saving which would otherwise be a loss, we have saws ground from 16 to 20 gauge, from about *c* to *d*, and they stand up well to a feed of 125 feet per minute in 1 inch yellow pine. We get six pieces of 13-16, one-fourth round, out of stock measuring 5 7-8 inches in the rough. Note the close working on both the saw and moulding machine. Well worth trying for, isn't it?—The Woodworker.

ELECTRIC DRIVE IN MODEL LUMBER PLANT.

By J. C. BREV.

The interest awakened among mill men in the use of electricity for transmitting power for saw mills, prompts me to tell about a plant which has been my pleasure to see in operation, wherein the idea of direct-connection motor to driving shaft is carried out most completely, and as the mill has been in successful operation for about four years, and is therefore not an experiment, it may be of especial interest.

On first entering the lower mill floor, the entire absence of shafting,

pulleys and belting is most striking. One would hardly realize being beneath a saw mill, were it not for the familiar song of the saw overhead. Only one line shaft is used, located in the wing of the mill and driving the lath mill. On the mill floor proper a 9 foot double-cutting band mill, a 6-foot slab resaw, eight-saw equalizer, 3 1-2 inch band rip saw, a jump cut-off saw, conveyors, live rolls, etc., are all direct connected, as is also the large "hog" for chewing up refuse. The edger and log haul-up are belted from the motor. Shotgun feed, nigger, kickers and trips are operated by steam. It is indeed a neat and most effective equipment, and the advantages are apparent at every hand, when one watches the mill in operation.

The ease by which any machine may be stopped and started independently, in case of a little mishap, or again if any department should become blocked during the day—say the lath mill—or some lumber to be re-edged or trimmed, a couple of hours' run at night, on that particular machine, leaves everything clear for the morning. Or, the clean-up man at night can run the conveyors helping to feed the furnaces, instead of leaving large heaps of refuse to be moved in the morning and over-running into the dusthouse, to be rehandled. But the principal advantage, in my estimation, is in installing the machines. There is no need of placing a machine to accommodate the structure, no cutting away of braces, weakening the building, no need of an intricate net of belting, no twist belting, nor hot boxes caused by misalignment of shafting. And the reduction of friction load is no small item.

One more point which appeals to me in favor of direct connected electric drive. The greatest objection to a ground-floor mill or factory has always been the difficulty of belting the machines properly without endangering the employes. The electric transmission overcomes this. While I am not familiar with the probable cost of such an equipment, the difference in building, shafting, pulleys and belts, ought to go a long way toward paying for "the new way." And, besides, there is no firmer foundation for machinery than concrete imbedded in solid mother earth.

With all these advantages it is but natural for the practical man to ask, wherein may the possible trouble be anticipated? Past experience has taught that when motors were chosen too light for the work intended, they would burn out. While all motors will stand a large percentage of overload, it is not policy to try running up to the capacity.

In the planing mill much the same policy of placing each machine independently of the other, is carried out. Same in the machine shop, which is also the repair shop for the railroad. In this shop is a steam engine, located so that in case of a breakdown of the power plant, repair work will not be hampered. The aggregate power of all the motors in use by this concern, is about 5,200 horse-power, and that the respective department heads are enthusiastic about electricity as a transmitting power for mills, is easily understood, and their share in bringing about great that it really deserves especial mention.

WOOD BENDING.

Wood bending is based on and consists of compression. Wood does not safely stretch a particle; if it does, it breaks. So when wood is bent the difference in the length of the wood on the inside and outside of the bend must be made up for by the compression. It is important to remember this fact for several reasons. One is to protect the wood on the outside of the curve from the tendency to stretch which may break it, the other is not only to select the right kind of wood but also to prepare it and get it in such condition that it will compress most readily. It is because a knot will not compress readily that it makes a serious defect in wood intended for bending, and because a knot can not be compressed readily, if it is present in that part of the wood which is to be bent, it is better to have it on the outside than on the inside, though, of course, it is best not to have it there at all.

Any wood may be bent to a certain extent, but of course, some woods bend more readily than others and usually the more tensile strength the wood has the better it is, provided this factor is not interfered with by unusual resistance to compression. An example illustrating this point is hickory, which has great tensile strength and bends well too, but not nearly as easily as it would if it were not so hard and difficult to compress. Elm, which has not the same tensile strength as hickory, but is softer and more easily compressed, will therefore bend more readily than hickory, and where the strength and hardness are sufficient to

answer the purpose it makes one of the best woods known for bending purposes. White pine, which is a wood easily compressed, seems to be shy in tensile strength and though it can be, and is, bent, it is not considered for most purposes a good wood to use in this way.

What might be termed the leading woods for bent work are hickory, oak, elm, ash, and there are lots of other woods that are bent and made to bend successfully, among them being gum, mulberry, yellow pine, willow, birch, and a number of others, but the ones named might be considered the leaders in the bent wood industry, and the others enter more as incidentals.

There are some woods that can be bent very readily by simply soaking them in water at ordinary temperature, and many times in the bending of light articles this is all the preparation resorted to. This would indicate that water or moisture is of more importance in the preparation of bending than heat. But it takes water and heat both to make the best combination.

Just what proportion of water and heat are best for preparing wood to be bent is a matter in which people differ somewhat, some going to one extreme and some to another. It doesn't hurt stock, and it is really good for it to be immersed in water and the water heated to boiling point by steam. Another method, and a good one, too, is to put the stock in a box or vat and let it get both the moisture and heat by turning exhaust or wet steam into it. Some people equip a steam box of this kind and use live dry steam. This, while it helps some, is not the best method. If live steam is to be used for the heat, it is best to have the stock immersed in water and heat the water with the steam.

The bending part of the work involves more complications than the boiling, and it is rather difficult to give in detail advice as to how best to do the work without knowing beforehand the exact amount of work to be done in each case, the kind of wood to be used, the form it is to be bent into, and the size of the pieces to be bent.

One of the many points to watch out for, is to protect the back or outside of the bend, to reinforce it, so to speak, while it is being bent, so that it may not give way through a sudden falling of too much strain on one point. The more thoroughly one can protect the back, not only through merely the preliminaries of bending but the entire process, the less loss there is from breakage and the better conformity there will be to the exact shape desired. If one should take a stick of wood and after it has been boiled properly for bending, cut it up into short lengths, it will be found that some sections of it will be compressed more readily than others. It is this difference in compressibility that causes the tendency to irregularity in bending. This tendency leads to kinks and ruptures if the back is not properly reinforced by what are termed straps in the process of bending.

One should be prepared, too, to bend the stock quickly, that is, bend it while it is fresh and hot from the vat; it bends better then than after it gets cool. Condensed from "Wood Craft."

EXPORT OF CANADIAN PULPWOOD.

In 1906 the United States imported 469,053 more cords of pulpwood than in 1905, and of that increase 93,000 cords was from Canada. The total export from Canada in 1906, was 738,872 cords, of which 721,323 cords was spruce, and 17,550 poplar. In 1906 there was exported to the United States, according to the report of the Agricultural Department of the Republic from Canada 116,258 tons of wood pulp, valued at \$2,503,362. This was a decrease of 10,000 tons as compared with 1905, which the report states, indicates that the Canadian manufacturers are finding a more profitable market elsewhere than in the United States. At the same time 2,605 tons of wood pulp was imported by Canada from the United States.

In loading lumber at Noyo, Cal., a unique system is employed, and while to the casual observer the method appears tedious, steamship people say it is a speedy and easy as loading from lumber docks. Noyo is a narrow rocky bay on the upper coast of California; so narrow in fact that a big lumber steamer has barely room to enter and turn. The shore line is in the form of a bluff about 150 feet in height. The steamer making port to load lumber anchors about 700 feet from shore, and when moored in the proper position, the lumber slings are sent out by means of wire from the shore.

THREE NEW MILLS ON VANCOUVER ISLAND.

Coincident with the sudden development of the west coast of Vancouver Island, caused by the projected extension by the C. P. R. of the Esquimalt & Nanaimo Railway from the east coast to Alberni on the west coast, comes the announcement that three large lumbermanufacturing plants will be erected at Alberni by the followings companies:—The Red Cliff Lumber Company, which has for many years been manufacturing pine at Duluth, Minn.; the Alberni Mills & Timber Company, with head offices at present at Ballard, Wash., and the British Columbia Cedar Lumber Company, whose present head office is located at Everett, Wash. Sites for these different mill companies have been obtained from the C. P. R., and it is understood that present intentions are to commence the erection of these mills next year. They will all be of considerable capacity, their output averaging about 150,000 feet per day. They will go in for both the export and the rail trade, ocean-going vessels reaching Alberni by means of Barclay Sound and the Alberni Canal, while rail shipment would be transhipped across the Gulf of Georgia into Vancouver, thence east by rail. The companies also have an eye to the time when the Panama Canal will render possible quick cargo shipments to the Atlantic seaboard.

THE TIMBER INDUSTRY OF NEW ZEALAND.

"The timber supplies in New Zealand are rapidly diminishing, both in quantity and quality," says Mr. W. C. Kensington, Under-Secretary of Lands, in a report presented to Parliament. "Whereas in 1905 there was estimated to be a total of 43,000,000,000 superficial feet of milling timber in the various districts, it now appears that the amount has fallen to about 36,000,000,000 superficial feet. Although the annual output has risen from 413,289,742 feet to 432,031,611 feet, a very large proportion of the remaining timber, though suitable for milling purposes, is not readily available, owing to the difficulty of communication. Other causes, such as smallness of areas containing milling timber, waste of timber in milling operations, destruction of forests by bush fires, and clearing land for settlement, and the necessity of preserving certain forests for climatic water supply, land protection, and scenic purposes, also tend to limit the quantity of timber available; and it appears certain that the supply is not likely to last beyond the seventy years estimated in 1905, and will possibly fall short of this period to a considerable extent.

"Timber merchants and the carpentering trade all over New Zealand require and demand to be supplied with suitable timber for their needs out of the forests now standing on unoccupied lands. The work of the contractor, builder, cabinetmaker, and allied trades would be seriously hampered if any great proportion of their requirements had to be derived from outside the colony, and as at the present time there are 411 mills in operation, employing 7,139 laborers, who, with other workers in the bush and their dependents, represent some twenty to twenty-five thousand souls, a severe blow would be dealt to the industry were its operations disturbed in this manner. Again, the process of felling and removing milling timber from the land largely helps to open it up for settlement purposes, and thereby assists in some measure the work of colonization. Considerations such as these tend to strengthen the arguments of those persons who desire to see our indigenous forests practically swept away to meet the requirements of the saw milling trade. But, on the other hand, it is essential to keep in mind the great lessons of past days, and to guard against a similar fate overtaking New Zealand as has happened to so many other flourishing countries in the world.

"The Government have for some years been gradually working with a view to supplement the resources of our native forests, and the efforts of the reforestation branch of this department have already made a perceptible difference in the quantity of timber trees that will be available for milling operations in some twenty years' time and onwards. Over 15,000,000 trees have already been planted out in the thirteen Government plantations, over an area of 6,810 acres, and distributed among domains, etc., while 15,000,000 trees are growing in the State nurseries, and are available for further planting. Much of the planting has been accomplished on the pumice plains between Rotorua and Taupo, and in the treeless parts of Otago, Canterbury, and Marlborough, and it is in the necessary and early development of and additions to these plantations that the future welfare and maintenance of the saw milling industry of this colony now lies. Those areas of pumice country and poor soil are peculiarly adapted for tree planting, and can be made to yield in this manner as profitable a monetary return as rich agricultural and pastoral land does in other parts of the colony."

DEMURRAGE DISCUSSION

Mr. C. M. Hays, Mr. William Wainwright, and Mr. George Biggar, representing the G.T.R., and Mr. Charles Drinkwater, representing the C.P.R., met the Government representatives in Ottawa, on December 17 last, with reference to the proposed legislation for this session affecting railway companies. In an interview with Hon. Mr. Graham, the railway representatives presented their objections to the proposed amendments to the Railway Act, providing for reciprocal demurrage and a two-cent a mile fare. They pointed out that the reciprocal demurrage clauses, as proposed, would be impracticable, in view of the fact that the railway companies could be held responsible for any delay in furnishing cars promptly to shippers, notwithstanding abnormal traffic conditions over which they had no control. It was also urged that under the present law, shippers were adequately protected against any undue delays in forwarding goods. Damages could be collected, either through the law courts or through an order of the Railway Commission, and such claims were being daily paid by the railway companies.

HYMENEAL.

On Sunday, Oct. 20th., the wedding took place at Golden, B. C., of Mr. Frederick D. Becker to Miss Selk, daughter of Mr. daughter of Mr. Selk, superintendent of the Columbia River Lumber Company, Limited, that city.

Mr. Becker is one of the most prominent young lumbermen in British Columbia, having first come here as manager of the Otis Staples lumber mill at Wycliffe, B.C. Later, as manager of the Staples & Company, retail lumber business, at Calgary, he became a prominent figure in Alberta retail lumber circles. He is now secretary-treasurer of the Monarch Lumber Company of Savonnas, B.C.

NOT PESSIMISTIC.

Mr. R. J. Crawford, of Leslie & Crawford, wholesale lumber and shingle dealers and timber land brokers, Vancouver, B.C., made a trip east last month and gave THE CANADA LUMBERMAN a call. Mr. Crawford is not pessimistic regarding the lumber market.

Current Trade Conditions

ONTARIO,

The holiday season finds the cus-
tomary stagnation in trade, a little
more marked perhaps than in for-
mer years, but showing promise of
a revival within the next few
weeks. At this period of the year
no special life is looked for in the
northern pine and hemlock busi-
ness. Movement by lake is over
for the season, and attention is con-
centrated on straightening up
stock for the winter and looking
after operations in the bush. Prices
in pine and hemlock are holding
steadily and no break is visible, de-
spite the continued weak demand.
Holders of the main supplies of
pine and hemlock are financially
strong and determined to make no
attempt to crowd sales for the im-
mediate future. That this policy
is wise is already evidenced by the
inquiries coming into Toronto from
outlying points. All the time there
is a steady reduction of stocks go-
ing on, while very little has been
done thus far to replenish them.

Many retailers are already con-
vinced that any reason they may
have had in the past for delay in
placing orders is no longer valid.
The market during the fall appear-
ed unsettled. It seemed possible
that prices would drop—a reason-
able expectation, had stocks been
large and a cut equal to last year's
been ready for the manufacturer
next summer. As it is, the finan-
cial alarm was sounded in time to
obviate the possibility of embar-
rassment from a surplus of lumber.
Already, however, equilibrium is
slowly but surely returning, and
early in the month it is conceded
that confidence will have been fully
restored and the lumber market
placed on a sounder basis than ever
before. After the temporary lull
the re-awakened demand will soon
press hard on the diminished avail-
able supply, a fact which will call
for attention before many weeks of
the new year have passed.

EASTERN CANADA.

Some transactions have recently
been made in "English" spruce at
figures which go to show that an
advance in price has certainly been

made. However, it is probable that
the lots in question have been pur-
chased by some dealers who have
been "caught short" and that the
prices paid were due to the man-
ner in which they were situated
rather than to any unwonted stim-
ulation of business. An enquirer
would probably be quoted from
\$12.50 to \$12.75 per thousand super-
ficial feet on a specification con-
taining say 50 per cent. 7's and
8's, 35 per cent. 9's and 15 per
cent. wides, f.o.b., steamer, St.
John, with two-third price for
fourths and ends.

The shipments by the winter
liners have been so far very light.
A few small lots have been for-
warded to the Bristol Channel, but
nothing has as yet gone to Liver-
pool. The C. P. R. steamers have
taken practically nothing in this
line. Freight rates are cheaper this
winter than last, 27s 6d to
30s per standard being the charge
this year as against 30s to 32s 6d
at this time last season.

Manufacturing is practically a
dead letter at most of the import-
ant plants and winter quietude has
settled down in shipping circles
also. Logging, however, is more
active, although operations in the
lower counties have been handicap-
ped because of the lack of snow.
During the winter months in past
years an element in the trade has
been the offerings of stock from
the portable mills of which there
were numbers along the railway
lines all through the province. The
lumber thus manufactured, owing
to the severity of the weather, the
increased cost of forwarding the
manufactured article and the extra
expense of keeping machinery run-
ning under difficult conditions,
costs considerably more per thous-
and than the output of the larger
manufacturing plants. These cir-
cumstances, in view of the low
prices now current throughout the
whole schedule, practically shut
out the portable plant.

WESTERN CANADA.

The getting out of railway ties
for the Grand Trunk Pacific and
for other lines also has had a some-
what beneficial effect on the indus-
try in the Prairie Provinces. In
Alberta 600,000 ties have been call-
ed for. Tamarac, jack pine or
spruce are acceptable. This de-

mand will do much to stimulate
activity in the lumbering industry
which has suffered considerably
during the financial stringency of
the past few weeks.

UNITED STATES.

The Chicago demand for white
pine is unusually small, despite the
fact that stocks have dwindled
down to extremely limited propor-
tions. Some of the city mills have,
it is said, insufficient stock to finish
the winter, but seem determined to
hold off until the trend of the
spring business can be determined.
There is, however, a fair demand
for the better grade of pine in
small lots. On the whole the con-
dition is satisfactory and inquiries
give promise of better business
shortly. Hemlock is in much the
same position, the market generally
being featureless. The marked cur-
tailment in the cut of yellow pine is
having a stimulating effect on the
market for that wood, although
there is still plenty of room for im-
provement.

The temporary suspension of
furniture manufacturing has had a
detrimental effect on the hardwood
market. Prices are being fairly
well maintained, however. Dealers
are satisfied that with the light sup-
ply of hardwoods in the country
and the great curtailment in the
cut that is taking place this winter,
the supply will scarcely be equal to
the demand next spring and prices
will stiffen considerably.

FINEST TIMBER SPLENDID LOCATION

PARTICULARS ON APPLICATION TO

CANADA MINERALS, Limited

75 Yonge Street, - Toronto

The Chicago market for red cedar shingles has become so quiet that Western manufacturers are said to be storing their product at points near that city, where they intend to keep them until higher prices are obtainable. In Washington the shingle shut-down is the most complete ever known. Cedar logs are said to be holding up well.

GREAT BRITAIN.

The lumber business in Britain is still being conducted on extremely quiet lines. The monetary crisis in America and the heavy efflux of gold from England has created a rise in the bank rate which now stands at 7 per cent. Speculative building has been reduced to a minimum. Apart from this, however, the lumber business generally is far from good, few of the industries on which the trade is dependent being well employed. The only redeeming feature has been the moderation of imports, a fact which has been responsible for the maintenance of values generally. The position of Canadian spruce is comparatively healthy as stocks are fairly moderate in extent, and at the same time there exists a decided shortage in some of the broader sizes.

Of pine deals there is not much to report. Very high prices are from time to time obtainable for small quantities of good stock, and small quantities are available. Hemlock is very little inquired for. Birch is improving both as regards logs and planks, while stocks are much reduced. Supplies of yellow pine at the leading centres consist mostly of inferior woods; nevertheless even for fresh guaranteed sawn timber sales are difficult and prices weak.

B. C. TIMBER LIMIT LICENSES.

While the British Columbia Forestry Association is attempting to secure longer options for timber leases the Nelson Board of Trade, the most important body of its kind in the interior of the province, is taking up for presentation at the meeting of the associated boards of trade of the Kootenay in January the question of survey of Government lands and the tenure of timber licenses. Views so far expressed are that speculators in timber

lands secure licenses and then allow the timber land to remain for years undeveloped. The Nelson board proposes that the Government be urged to change the regulations so that holders of timber lands must begin development in one year and continue each succeeding year.

HARDWOOD MARKET CONDITIONS.

The last fortnight has been the dulllest in hardwood sales the country over, that has been experienced in a good many years, says the "Hardwood Record," under date of December 25. This condition has resulted from various causes, particularly close finances and a determination on the part of buyers to make no new obligations for the year, due to their uncertainty as to how business would start off in 1908. In spite of this situation leaders in the hardwood industry look upon it with a good deal of optimism. Every indication points to a renaissance of fair trade for the first of the year, which it is fully expected will develop into a normal tide of business by early spring.

A large factor in the buying trade is the furniture industry, notably in the Middle West, and as the annual furniture sales exhibitions will open early in January lumber buying from these corners will depend very largely on the business booked at these shows. Indications are favorable to a considerable volume of purchases taking place shortly after January 1 in that a good many woodworking institutions which closed down in November and early in December have resumed operations with evident business in sight to keep them going.

According to Churchill & Sim's wood circular of December 4 the quantities of Canadian woods on the London docks on November 30 last were:

FROM THE ST. LAWRENCE			
	1907		1906
Pine Deals	761,000 pieces		837,000 pieces
Spruce "	1,038,000 "		1,838,000 "

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies
are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are
Johnson's Horse Liniment No. 1.
A penetrating Alcoholic Liniment.
Put up in 10 e gallon jugs, with full directions, per imperial gal. \$4.50

Johnson's Horse Liniment No. 2.
A combination of the best oils used as liniments, imp. gallon . \$3.00

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic
Imperial gallon \$5.00

Johnson's Veterinary Healing Ointment.

Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada.
Put up in 2 lb tins, each . . \$2.25
or in 1/2 lb tins, per dozen . . \$3.50

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb 30c.

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating liniment, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to \$100.

Send postal for printed matter.

Board of Trade Building, Montreal

THE NEWS

Therrien & Therrien, lumber dealers, Montreal, Que., are reported to have dissolved.

The lumber firm of Cann & Ingle, Stony Plain, Alta., have been succeeded by Ingle & Miller.

L. A. Croteau and J. A. Piche have registered a new lumber firm at Montreal under the name of the Canadian Supply Company.

On Christmas day the steamship "Oanfa" left Evans, Coleman & Evans' wharf at Vancouver for Liverpool with a cargo of 150,000 feet of lumber.

It is reported that the International Paper Company, of New York, have acquired an interest in the Dalhousie Lumber Company, New Brunswick, and that application is being made to increase the capital stock of the latter concern.

Fire losses sustained at Woodstock, Ont., during the past twelve months amount to only \$855. At London, Ont., the damage for the same period amounts to about \$20,000, the lowest figure to go up in smoke at the Forest City for thirty years.

A new Quebec lumber firm, Carriere Brothers, Limited, have just been incorporated with head office at Hochelaga. The capital is registered at \$150,000. Amongst the incorporators are L. A. and F. Carriere, M. Benoit, W. Levert and F. Dufresne.

An action brought by the Independent Lumber Company to recover \$30,000 damages for alleged breach of contract to supply six million feet of lumber was decided in favor of the defendants owing to the fact that the contract was not duly signed and attested.

Carter Stevens Lumber Company, Limited, are another new firm to secure incorporation. The capital of this concern is \$40,000, and the head office is at Toronto. J. B. Bartram, Frederick Rielley, R. Eustace and V. V. Stevens, all of the Queen City, are the incorporators.

Owing to the refusal of the Vancouver lumber dealers to cut their prices, the Grand Trunk Pacific and White Pass Railway Company have purchased four million feet of ties and timber from the Puget Sound mills, where a reduction of between \$2 and \$3 per thousand is said to have been obtained.

Whilst deer hunting recently near Prince Albert, Sask., Crown Timber Inspector Robertson was lost, and in spite of the expedient organization of searching parties no trace was found of him for forty-eight hours. He was finally saved by his knowledge of woodcraft, which enabled him to recover the trail.

A branch of the British Columbia Forestry and Timber Chamber of Commerce has been organized at Victoria, B.C. The followings officers have been elected: Hon. president, John Arbuthnot; president, A. B. Ellis; vice-president, C. L. Betterton; 2nd vice-president, D. Stevens; secretary-treasurer, H. H. Jones.

The British Columbia "Gazette" contains notice of the incorporation of the following firms: British Canadian Pulp & Paper Company, Limited, capitalized at \$1,000,000; the Columbia River Timber & Transportation Company, Limited, capitalized at \$50,000; the Sims Timber Company, Limited, capitalized at \$250,000, and the Port Douglas Lumber & Trading Company, Limited, with a capital of \$100,000.

During recent logging operations at Port Haney, B.C., a logger named John Telpash met with a terrible accident. He was working on the spring-board, and missing his footing when the tree started to fall, he became entangled in the sweeping branches, and was hurled through the air and badly crushed. So agonizing was the man's pain that he became insane shortly after his removal to the hospital. Telpash has a wife and eight children.

In order to stop the cancellation of contracts, a particular grievance of Western dealers, the Puget Sound mills are organizing the formation of a powerful combine to resist the methods of Eastern buyers, who, it is alleged, often cancel their orders, even after the shipments are on the way. Some of the leading timber dealers of the Pacific coast are backing this movement, and within a short time it is expected that every British Columbia lumber manufacturer of any note will have joined the cause.

Mr. M. L. Gordon, D.L.S., formerly of Toronto, has opened up offices at 619 Hastings street, Vancouver, where he is engaged in his profession of engineering and surveying. Mr. Gordon is a McGill graduate, and has been engaged on tunnel construction in Detroit and New York and other engineering projects in the south and east, and he also had considerable experience in surveying in Western Canada. For some time past he has been connected with the engineering firm of Hermon & Burwell, Vancouver.

Mr. Antoine Charest, timber expert of Ottawa, will celebrate, on the 7th inst., the fiftieth anniversary of his marriage to Melina Latour. After spending many years in the lumber business Mr. Charest has become an explorer of the great forests of Canada, either for the Governments of our different provinces or for the great lumbering companies. His rare experience has enabled him to render efficient service to those who have employed him, and to draw reliable maps for all those who take any interest in the Canadian forests. Mr. Charest has been called upon to do work for most of our lumbermen. They have thus been able to judge of his competence in the matter and also to appreciate his sterling qualities as an honest business man.

That the vast resources of Canadian forests are receiving attention outside the Dominion was well evidenced by a meeting of the Wisconsin pulp manufacturers,

WINNIPEG - MAN.

hold a short time ago at Appleton, to discuss the chances of securing a large area of pulpwood timber land in Canada. We do not know what ideas of trade these gentlemen would follow in this country, but it is mooted that coincident with their proposed inroad on Canada they are endeavoring to secure the control of all the pulp mills in Wisconsin, Minnesota and Michigan.

Simultaneously with a fire at the Elliot box factory, Toronto, which occasioned a loss of more than \$160,000, there recently occurred an \$18,000 blaze at the Woodbine Planing Mill, a substantial two-storey brick building, fitted up with a modern plant, which at a comparatively recent date had been doubled in capacity. On the ground floor was the planing mill, and on the upper floor was the sash and door factory. Part of the machinery fell from the second floor during the fire, but the greater portion of it will be readily adjusted. It is expected that the plant will be rebuilt and ready for operation by April next.

The recent formation of the Fort Alexander Lumber & Manufacturing Company at Winnipeg will mean an important addition to the Western trade. W. F. Hepburn, St. Thomas, Ont., is president and general manager, and this gentleman will now take up permanent residence in Winnipeg. It is interesting to note that this same Mr. Hepburn contested East Elgin with A. B. Ingram for a place in Parliament in the year 1904, being defeated by the narrow margin of twenty-one votes. Other officers of the company include J. A. Collier, vice-president, a well-known builder of Minneapolis, who is also removing to Winnipeg; William Whyte, treasurer, also of Minneapolis, and M. F. Sproule, secretary, of Winnipeg.

For the past few years there has been conducted on the Pacific coast a lumbermen's mission, in which connection hospital service has also been established. We are pleased to note that the Reverend John Antle has just returned to his sphere of labors after a successful tour in the east for the purpose of soliciting financial support. The value of such an organization cannot be over-estimated. Aside from the benefit accruing to the loggers from the spiritual ministrations of men like Mr. Antle, the institution of a hospital is of inestimable value to men engaged in so hardy a following. Notwithstanding the closing of some of the camps, the good work of the "Columbia," the lumbermen's hospital ship, will be continued throughout the winter.

An interesting action has been brought by the British Columbia Timber & Trading Company against the Red Cedar Lumber Company to recover \$13,326 for trespass and the wrongful cutting of 132 trees representing 755,870 feet of lumber. The Red Cedar Company admit the trespass and the cutting, but declare that it was wholly unintentional. The only question left is as to the damage, and the plaintiffs' method of computing this is seriously disputed by the defendants, who have offered \$500 as the full compensation to which in the defendants' view the plaintiffs are entitled. The British Columbia Timber Company compute the damage as follows: \$9,826, value of the timber cut, \$1,000 injury to other trees, and \$2,500 for other losses. The limits are in Howe Sound district, British Columbia.

CANADIAN VS. AMERICAN MANUFACTURING.

The Dodge Manufacturing Company of Toronto have asked us to make reference to their very complete and extensive facilities for the manufacture of elevating, conveying and power transmitting machinery. They inform us that their plant at Toronto is just as complete and modern as those of any of the big fellows on the other side of the line, and that there is no contracting problem that they cannot take care of just as well as any of the U. S. companies, while, in many cases, they say that better work is done right here in Canada.

Mill men, having contracts to place for material such as that made by the Dodge Company, are invited to ask for bids.

NEW YEAR SOUVENIRS.

From the Whitney Engineering Company we have received a very handsome calendar for 1908. The illustration is taken from C. M. Russell's famous painting "Cowboy Life," the result being unusually effective.

A calendar just issued by the Alberta Lumber Company is also peculiarly fitted for the Christmas season and bears ample testimony to that firm's enterprise.

A handy office calendar has also reached us from the Canadian Fairbanks Company, no attempt has been made in the way of a lithographic display, utility rather than beauty having been sought.

From West & Peachy, Simcoe, Ont., comes a calendar that is peculiarly for lumbermen. A picturesque rafting scene is the subject portrayed.

To the Owen M. Bruner Company, wholesale lumber, Philadelphia, we are indebted for a very unique and useful souvenir in the form of a blotting stone, to be used instead of blotting paper and also as a paper weight. Accompanying it is a card conveying their best wishes to their friends and customers.

The 1908 supplement to Catalogue No. 17 of the Marine Iron Works, Chicago, has reached us. It contains descriptive matter and copious illustrations of the products of that firm—"marine exclusively—steam only."

DeLOACH "PRINCE" HAND FEED SHINGLE MILL

JOHN H. CRANE,
MANUFACTURER OF
LUMBER AND SHINGLES,

MONTEREY, ALA., JULY 2, 1907.

DeLOACH MILL MFG. CO.
BRIDGEPORT, ALA.

Gentlemen, I purchased from you in 1905 a "Prince" hand feed shingle machine. I have operated it and find it all you claim for it. We cut at the rate of 30,000 shingles in 10 hours and made first class shingles. I consider your machine a very light running machine. If I wanted another hand machine I would certainly buy a DeLoach Prince.

With best wishes for your success, I am,

Yours very truly,
John H. Crane.

Send for Catalogue of Engines, Boilers, Gasoline Engines, Saw Mills, Shingle Mills, Planers, Gang Edgers, Lath Mills, Grinding Mills, Water Wheels, Etc. Complete Circular and Band Mill Equipment.

FREEZE'S PATENT BELT LACING TOOLS

You will find that by using
you will save more than half the time usually lost in lacing belts. Consider—
How much do you lose every year by reason of machinery standing idle while belts are being laced.
You can stop over half of that leak by using the above named tools for running leather laces into belts. They will be sent to any address in Canada by mail on receipt of price with order, and with ordinary care they will last a life-time. *Price 50 Cents Each.*

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

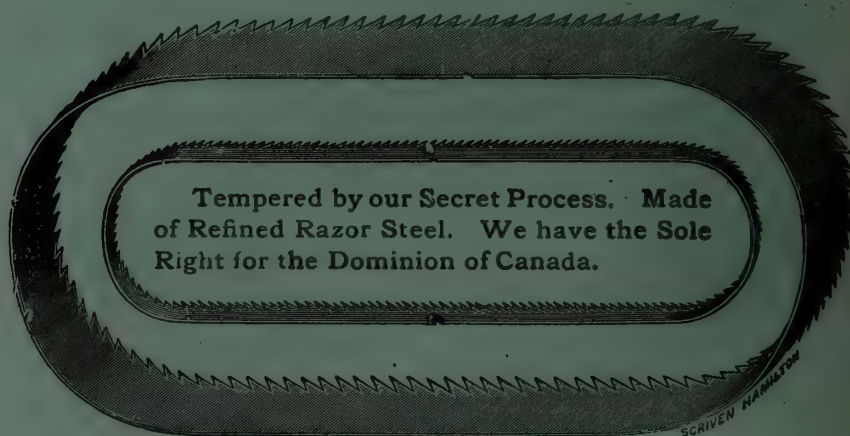

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. On receipt of 40 cents we will send one by mail.

We are the only manufacturers in the world who export Saws in large quantities to the United States.

We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

1908 ?

IT is our opinion that business prospects for 1908 are good. We believe that the panic which recently struck us, and which prevailed for a couple of months, has already partially resulted, and in the near future will completely result, in clearing the financial and business atmosphere. We began to anticipate stormy times as long ago as last spring and the recent panic justified our anticipations. The variation from our expectations came in the form of the storm. We expected it to begin easily, to grow more and more severe as time elapsed, and to extend entirely through 1908, whereas it happened that it thundered and lightened incessantly and rained cats and dogs while it lasted, but only lasted a couple of months, and now the air is clear for 1908.

We believe that the recent panic was the culmination of frenzied finance plus anticipation of presidential year in the United States. We are confident that the New Year will as a whole show better aggregate business than it would have shown had we not suffered the panic, for the business community has now discounted presidential year.

In general trade there is no over-production along any line. The farmers have generally enjoyed fair to good crops and are realizing satisfactory prices therefor.

The railways are showing wonderful earnings, considering the fact that business has supposedly been badly knocked out.

The people as a whole have money,—either in the bank or in their stockings. They will be disposed to spend some of it soon. In short the panic is over, the air is clearing, and it is time for the calamity howlers to retire into obscurity.

LARGEST AND BEST ASSORTED STOCK OF DRY SPRUCE IN CANADA

COBBS HIGH PRESSURE SPIRAL PISTON AND VALVE ROD PACKING

"Cobb's" Packing is especially adapted to withstand heat and highest pressure. The rubber core is oil and heat-proof and will not harden, but remain elastic indefinitely. The outside covering is made of material that is not affected by heat. The lubricant employed is the result of much scientific research and is absolutely free from grit or acids.

We make everything in rubber requisite for an engine room. The following are some of our specialties:

VULCAN SPIRAL PACKING, MAGIC EXPANSION SPIRAL PACKING, AMAZON HYDRAULIC SPIRAL PACKING, INDESTRUCTIBLE (WHITE), KARBONITE (BLACK) RUBY (RED), AND SALAMANDA SHEET PACKINGS, RUBY SECTIONAL CASKETS, GAUGE GLASS RINGS, DISCS, BIBB WASHERS, PUMP VALVES DIAPHRAGMS, PACKING RINGS, RUBBER BELTS, &C.

Simonds Machine Knives

Simonds Machine
FITCHBURG
MASS.

Always

Not heavier on one end than on the other; not thick toward one end and thinner at the other, just an even gauge, no matter where you test it. Accurately ground, uniformly tempered, nicely finished, are the characteristics of Simonds Machine Knives. The amount of use you get out of a knife made for the work you have to do depends on two things—the Machine and the Knife. Over the first we have no control, but we do aim to make our knives so that they will run smoothly, cut fast and evenly and give you good finished lumber. Pattern blanks for ordering furnished free on request.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other
foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOOD-WORKER is published in the interest of and reaches regularly persons engaged in the lumber, wood-working and allied industries in Ontario, Quebec, Nova Scotia, New Brunswick, Newfoundland. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN AND WOOD-WORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — JANUARY 15, 1908 — MONTREAL

TIMBER LEGISLATION ON THE PACIFIC COAST.

Much comment has naturally been rife in Eastern Canada at the action recently taken by the Government of British Columbia in reserving all unstaked timber lands, with the view, it is said, of preventing the further staking of such for speculative purposes. How far this will affect operators already in the field is a question as yet undecided, but consideration must be given the legitimate rights of those who have but recently commenced cruising operations at a considerable outlay. To suddenly "spring" radical changes in the methods that have heretofore prevailed in the holding and exploiting of British Columbia timber limits would be as unwise as unfair.

Nevertheless it must be conceded that the policy of the Government in the past of encouraging the taking out of licenses, while at the same time limiting their life, with no definite assurance that a renewal would be granted, has been not the most commendable. It is, of course, tacitly understood that licenses will be renewed at their expiration, but a tacit understanding in a matter of such importance is not sufficient. The whole subject should be taken out of the domain of probabilities and of equities and put into statutory form. Even at the present time a very serious situation might confront the lumber industry should it be considered wise by the Government to make no more extensions of the twenty-one year limit, but still more serious would the final outcome be for the province as a whole. Should licensees have reason to apprehend short-lived licenses there is little doubt but that they would make every effort to cut all the timber possible within their license periods, thereby imperilling the stability of the market and, what is still more to be apprehended, seriously diminishing the timber wealth of the province. Assuming that conditions remain as they are and that all the timber under license is to be cut within the average license period, it would mean a production of something like 3,000,000,000 feet annually for the next twenty years, without taking into consideration the timber that is cut from Crown grant lands or from lands held under the old system.

Some idea may be had of the expense which attaches to cruising

operations from the following figures, gathered from a cruiser's note book, and showing the cost of conducting a winter expedition from Fort George: "Dog team, \$1 per day for each animal (the ordinary team consists of six animals); toboggan, 50 cents per day; driver, \$2.50 per day; helper, \$2.50 per day." The ordinary outfit embraces four men, two cruisers, driver and helper, and the expedition must be furnished to extend over at least three months. As a precaution against accident and to further the ends of the expedition, it is customary to have two cruisers attached to the party. To provision one of these parties is no trifling matter, as is evidenced by the following prices obtaining at present at Fort George: Bacon, per lb., 42 cents; flour, per cwt., \$13; beans, per lb., 22 cents; tea, from \$2.50 to \$7 per lb.

Moreover, the new legislation is doubtless aimed to check in some measure the apparent craze for timber investment that during the past twelve months has been so pronounced. Eastern Canadian, American and native lumbermen have vied zealously with one another in securing and staking out large tracts of timber in all parts of British Columbia. This demand is shown conclusively in the number of timber cutting licenses, which for the past five years totaled as follows:

1903	1,307
1904	1,451
1905	2,175
1906	3,959
1907 (six months ending June 30)	4,245

These figures are exclusive of hand-loggers' licenses and they show a remarkable increase in the acreage of land staked, as each license represents approximately 640 acres, so that the number of acres covered by timber licenses in each year would be:

	Acre.
1903	836,480
1904	938,640
1905	1,390,720
1906	2,534,000
1907 (to June 30, six months)	2,716,800

This large increase for the first half of 1907, coupled with the fact that the number of applications for licenses has shown but slight diminution, even during the period of financial stress, clearly indicates that the area under license by the end of 1907 must have totaled more than double that of any former year.

All the most available timber, bordering upon tidewater, navigable streams and lakes, has been already acquired by licensees, and now the interior has to be penetrated in places where logging roads will be required, thus greatly increasing the first cost of production.

The lumber cut for the past four years illustrates the great increase in the output of British Columbia mills:

	Feet.
1903	317,551,151
1904	348,031,790
1905	473,713,986
1906	508,069,969

Although the number of timber licenses is increasing at an unprecedented rate there is a decided upward tendency in the price of standing timber, but compared with stumpage values in Eastern Canada and the United States, they may be regarded as extremely moderate, yet the total revenue from timber for the fiscal year, ended June 30 last, amounted to \$1,261,220, by long odds the highest figure ever reached in the history of the province. During the summer licenses were being issued as rapidly as the Department could prepare them, the total for one month exceeding 1,000. For the year ended June 30 last the total collections for timber licenses was \$893,349.77. This represents about 7,150 licenses issued, which would represent staked timber land to the extent of nearly four and a half million acres. The following shows the various sources from which this revenue was obtained:

Timber royalties	\$252,877.11
Cordwood royalties	1,995.90
Scaling fees	11,215.93
Timber leases	95,219.90
Timber licenses	893,349.77
Hand-loggers' licenses	4,618.00
Timber transfers	1,944.25

Total \$1,261,220.86

Should this rate be long continued it is obvious that the available timber in the province would soon be entirely in the hands of licensees, for, on the whole, British Columbia is not heavily timbered. There are extensive semi-barren areas in which timber is lacking altogether or is stunted because of climate, soil or elevation.

In view of the awakening interest manifested in all parts of Canada in our timber resources, it was to be expected that presently the Coast Province would take action. This has been done, not a day too soon, and the completion of legislation looking to the wise and economical exploitation of our Western timber heritage will be watched with interest by lumbermen throughout Canada.

EASTERN CONCERNS HAVE A CHILL.

The demand for power and motive equipment in Vancouver is a good criterion of the trend of the times. Power in use makes work for a multiplicity of hands. Power drives wheels and wheels turn machines, while skilled men are required to operate them. Skilled salesmen and clerks have to do with the disposal and shipment of the products. Railways must move these and men must operate the trains. Power is the root of much commercial activity, and there is no more promising indication of the continued industrial activity of British Columbia than the present exceedingly active demand for both power and equipment right here in Vancouver. Local equipment houses were never so busy as at the present time, and December has witnessed one of the largest month's sales they have ever enjoyed. One house has a single order requiring \$38,000 worth of transformers alone. Telegraph orders for carloads of equipment are constantly being sent forward to rush the big shipments needed for immediate delivery.

This condition obtaining simultaneously with the completion of the British Columbia Electric Railway Company's new 10,000 horse-power unit at Lake Buntzen is a very promising augur for not only a continuation of our present and past prosperity, but a greater industrial activity than ever, for the immediate future.

In discussing this situation a prominent business man says that manufacturers and other British Columbia business men seem to be preparing to seize the opportunities which Easterners, who have contracted a chill in their pedal extremities, are leaving open to them. The fact is that many Eastern manufacturers have underestimated the situation in the West, and, in the belief that matters are much worse than they are, have relaxed their efforts in this market.

This is shown by reports constantly coming in to the effect that Eastern wholesale houses are withdrawing their travelers. One big house has taken off all its travelers and is send instead a weekly list to its customers. Western wholesale houses and manufacturers are apparently getting ready to capture the trade the Easterners are neglecting, and Vancouver people are taking the lead in the movement.—Saturday Sunst.

PRICES OF NORTHERN PINE.

The "American Lumberman," under date of December 4, writes as follows regarding the hemlock and white pine situation in the United States:

Several of the larger northern pine manufacturers have issued new lists which when compared with the August lists show reductions of \$1 to \$3. The greatest reduction, \$3, was made on 4 inch No. 3 fencing. Common boards, including No. 1 and No. 2 fencing, were reduced \$1; No. 3 fencing, 6 inches, \$2; 4 inch No. 1 and No. 2, \$2; 4 inch No. 3, \$3; C and better, \$2; C and bettersiding, \$2; D and E siding, \$1. The prices of lath have been lowered 50 cents and 32 inch lath now are quoted at \$1.50 at the mill.

Until the last few weeks the prices of northern pine have been very little affected, although some operators have made concessions of \$1 from the August list. It was decided, however, by those who took the lead in this matter that owing to the low prices at which fir and yellow pine were being offered in the north, and the lower wages at which workmen could be secured, a readjustment of values should be made.

The northern pine manufacturers assert that the old list could have been maintained but they deemed it advisable to rearrange selling values in accordance with market conditions, if for no other reason than to demonstrate to the public that the cost of manufacturing lumber is the controlling factor which fixes the selling price.

Those operators who have changed the list in accordance with the foregoing schedule of prices believe that they can sell their products at full list when the market rights itself again. The present range of prices is about in line with those in effect eighteen months ago. The several advances made during the last year and a half have been practically wiped out by the reductions quoted.

The November report issued by Secretary Rhodes, of the Northern Pine Manufacturers' Association, shows a decrease in shipments this year by northern pine manufacturers of 6.2 per cent., the total shipments being 1,544,256,025 feet for eleven months of 1907, while the total for the same period in 1906 was 1,648,042,855 feet, a loss of 103,786,830 feet. The hemlock mills report a decrease in shipments for November of 7,599,500 feet, or 31.5 per cent. The hemlock showing for the year however, is good, an increase of 4.2 per cent. being shown for the first eleven months.

Reports from Minneapolis show receipts of 11,585 cars and shipments of 18,167 cars. The figures for the last year were: Receipts, 12,715 cars; shipments, 20,091 cars.

	1906.	1907.	Decrease.	cent.
January	177,941,373	102,230,281	15,711,092	13.3

Totals	1,648,042,855	1,544,256,025	103,786,830	6.2

*Increase.

Shipments of pine lumber as reported by the mills in the Northern Pine Manufacturers' Association for eleven months of 1907 were:

Hemlock mills also reported a decrease of shipments in November. There were fifty-four mills of the Northwestern Hemlock Manufacturers' Association reporting, and they showed a decrease for the month of 7,599,500 feet or 31.5 per cent. The showing for the year to date is still good, there being an increase of 4.2 per cent. on the eleven months. Hemlock shipments by months were as follows:

	1906.	1907.	Increase.	cent.
January	19,900,587	21,445,504	1,544,917	7.7

A GIFT TO THE UNIVERSITY.

Professor Fernow, head of the Department of Forestry in the University of Toronto, has done a great service to the work in which he is engaged in donating to the library of the University for the use of students in his department his entire collection of more than 2,500 books, pamphlets and magazines dealing with forestry and kindred subjects. There are perhaps not more than two collections of equal value on the continent.

RESERVE ON B.C. TIMBERLANDS.

The question has been asked as to how the new reserve on Western timberlands will affect purchasers who have recently staked their limits. Although no official statement has as yet been made, it is understood that all stakings made prior to December 23 will not be affected by the action of the Government, while no title can be secured to timber staked on, or subsequent to, that date.

A PULPWOOD POLICY FOR CANADA*

By PROF. A. SHORTT, Queen's Univ., Kingston.

We have heard a great deal within the past year of the inroads which our American friends are making upon our pulpwood forests, and of the serious danger which threatens a great national resource if this movement is to continue unchecked. The remedial measures commonly suggested are the prohibition of the export of pulpwood, or the imposition of a heavy export duty. The primary object, in either case, is to foster the manufacture of pulpwood into paper in this country, and thereby to increase the national revenue from this important raw material. In some vague way it seems to be assumed that this will result in conserving our pulpwood forests for an indefinite time.

There is indeed little doubt that the United States, owing to the reckless treatment of its forest areas in the past, and the very great increase in the demand for paper of late years, now find themselves within quite measureable distance of the exhaustion of their supply of pulpwood. Under the circumstances, they are naturally turning to Canada in search of future supplies. The question therefore arises, what is to be the national policy towards this new situation?

The most popular policy at present appears to be the very familiar one of taking advantage of one more or less monopolistic situation to lay our neighbors under tribute—a policy from which it is very improper to have to suffer, but which it is very proper to inflict upon others, when they are unable to retaliate. Fortune favors those who help themselves, and in trade matters the most familiar shape in which the favor of Fortune is courted, through self help, is to secure the imposition of such a duty on imports as, creating a protected market at home, enables the manufacturer to provide more or less at the expense of his fellow-citizens. But if, in addition to an import duty on foreign goods, the manufacturer can secure an export duty on his raw materials, which will naturally lessen their market value at home, he will enjoy a further advantage at the expense of his fellow-citizens. To accomplish such results is not unnaturally designated “good business” and Fortune, it must be admitted, very commonly favors those who thus help themselves. If, again, the goods of some such manufacturer are required not only in his own country, but in a neighboring country as well, where an increasing portion of the raw material required must be obtained from the first country, then, by imposing an export duty, or a prohibition of the export of raw materials, the favored manufacturer can lay not only his own people under tribute, but the foreigner also. In the latter case this is not only good business, but it is good business surmounted by a halo of patriotism.

In these last days, however, in order to render this excellent system of individual prosperity quite permanent, a further condition of protected privilege is required. In some way an embargo must be put upon the importation of foreign capital. For a long time capital did not migrate as freely as goods, hence protection against it was neglected. But conditions are rapidly changing. If free trade in capital is developed, the monopoly feature of both import and export duties is liable to be impaired, more especially if the foreigner is interested in the goods to be produced.

If a manufacturer is prevented by prohibition, or an export duty, from getting necessary raw materials, such as pulpwood, from an adjoining country, he will tend to invest freely in the erection of pulp and paper mills in the country supplying the pulpwood. He will then import to his own country the finished article instead of the raw material. But this process when completed will make the same demand for raw materials as under free trade, and will bring to the supplier of pulpwood as large a demand and as high a price as if there were no limitations on export. The consumers of paper in the country of manufacture will also obtain as cheap supplies as if there were no protective duties on that article. So far, then, as free trade in capital is permitted, as between countries, and is actually brought about by import or export duties, protection ceases to be effective, and the domestic manufacturer is subject to more vigorous competition than that from without.

In the light of these conclusions, what of the problem of the protection of our pulpwood areas from devastation by the foreigner? Evidently an export duty is no protection whatever. So far as clearing off the pulpwood of Canada is concerned, it is not of the slightest consequence whether the pulpwood is to be manufactured into paper for the American market, in Canada or in the United States. If it is manufac-

tured in Canada the capital employed in the process will benefit Canadian trade as a whole, even though every employe should be a foreign immigrant, and all the profits of the business should pass to foreign capitalists. But this does nothing whatever to conserve the Canadian pulpwood forests, or to prevent as rapid a destruction of them as if the free export of pulpwood were permitted.

What is wanted under all circumstances is a definite public policy for the conservation of our timber limits of every description. There is required a system of rules and regulations, as simple as possible, but thoroughly enforced, for the cutting of pulpwood on limits leased by the Government, and as far as practicable adopted by the private holders of large areas of virgin forest. These rules should ensure, under the conditions alike of practical and scientific forestry, a constant renewal of the timber and pulpwood crop. Instead of taking from an area once for all, every available sawlog or stick of pulpwood and leaving the remainder a prey to the flames, to be followed by a perpetual wilderness, there should be ensured a periodic harvest of marketable timber, thus rendering our forests a perpetual source of income. Under these conditions both foreign and domestic paper-makers would adjust themselves to the same terms, under whatever policy might be adopted with reference to export or import duties on pulp or paper.

A THOUGHT FOR THE NEW YEAR.

The Beaver Lumber Company have sent us a neat booklet with their New Year's greetings. Evidently this firm thought it behooved them to do their share in brightening the present trade gloom and have availed themselves of this New Year custom to put zest into their patrons and friends by reprinting for them in attractive form that stirring poem “Grin,” by Robert W. Service. It is as follows:

GRIN.

If you're up against a bruiser and you're getting
knocked about—

Grin.

If you're feeling pretty groggy, and you're licked be-
yond a doubt—

Grin.

Don't let him see you're funkng, let him know with
every clout,

Though your face is battered to a pulp, your bloom-
ing heart is stout;

Just stand upon your pins until the beggar knocks
you out—

And grin.

This life's a bally battle, and the same advice holds
true,

Of grin.

If you're up against it badly, then it's only one on
you,

So grin.

If the future's black as thunder, don't let the people
see you're blue;

Just cultivate a cast-iron smile of joy the whole day
through;

If they call you “Little Sunshine,” wish that *they'd*
no troubles too—

You may—grin.

Rise up in the morning with the will that, smooth or
rough,—

You'll grin.

Sink to sleep at midnight, and although you're feel-
ing tough,

Yet grin.

There's nothing gained by whining, and you're not
that kind of stuff;

You're a fighter from away back, and you *won't* take
a rebuff;

Your trouble is that you don't know when you have
had enough—

Don't give in.

If Fate should cown you, just get up and take
another cuff;

You may bank on it that there is no philosophy like
bluff—

And grin.

—From “Songs of A Sourdough,” by Robert W.
Service.

*From the Christmas “Varsity.”

BRITISH COLUMBIA TIMBER REGISTRATION.

The reservation of all unlocated timber lands by the Provincial Government does not in any way adversely affect the desirability of granting the petition to the Legislature adopted by the British Columbia Timber and Forestry Chamber of Commerce.

The first prayer of that petition is that the time limit for renewal for special timber licenses be extended at the expiration of the present renewal period for a second period of twenty-one years, subject, of course, to such terms and conditions as regards license fees, royalties, and other matters as may be deemed wise by the Government of that day to bring them in harmony with the changed conditions then obtaining.

This request is made in view of the enormous amount of timber already under license. The reserving of vacant lands simply prevents a further aggravation of the situation. The situation is that very much more timber has already been placed under license than can be cut with advantage to any of the parties concerned within the twenty-one years during which the licenses may be renewed. Timbermen believe that an extension of the renewal limit, such as is being asked for in our petition, would be of very much greater value to the public generally than to the owners of licenses, and is indeed necessary as a measure of protection for the provincial forest resources and the capital invested in the lumber industry.

It has been said, and very properly, that no government would be justified in laying down at the present time the terms under which the timber standing on special license lands will be logged two decades hence. It will be observed that there is absolutely no suggestion in the petition as to the terms, financial or otherwise, under which this timber is to be cut, if cut during the extension asked for. The government of that day will have the fullest liberty to make such terms and regulations as may at that time be found equitable and expedient.

But, it may be asked, why not also leave the matter of extension of the renewal limit to the future as well? The answer is simple. If the owners of special licenses do not certainly know in advance that an extension will be granted, they will for the plainest business reasons be forced to proceed at once to cull what they may from their lands, with the idea of abandoning them as soon as they have logged whatever might be found merchantable under the artificial market conditions created.

Just here I should like to comment on a Victoria estimate of the amount of timber standing on lands held under special license. A despatch from the capital to the "News-Advertiser" on December 26 states that it is "at least 3,200,000 feet." This, on six and a half million acres, is a trifle under 500 feet per acre, or a log on every two acres, or one tree on every six acres. If this estimate were anything like correct I submit we should have no case. Now six and a half million acres of forest in Germany produce more than three billion feet by actual growth every two years, and trees grow much more rapidly here than in Europe. It is the belief of practical woodsmen that ten thousand feet per acre, or about seventy feet, is the lowest possible estimate for the stand on licensed lands to-day, and, if they were logged as they should be logged, that the cut would certainly exceed one hundred billion feet.

The object of the second prayer of the petition, namely, that the present license fees be declared to be statutory for the present renewal period is merely to remove doubt on this point, it being a matter of dispute as to whether such is or is not the law as it stands at the present time.

While not in any way weakening the position taken by license holders in their petition, the reservation of vacant timber lands by the government quite eliminates the two objections to the extension of time asked for which have been seriously put forward, namely, that such an extension would make a monopoly of standing timber possible, and secondly, that such an extension would defeat its object by encouraging the location of still greater areas than could be logged advantageously during the forty-two years.

In thus effectively providing against monopoly in so important a raw material by reserving a portion of the public timber domain, the government has wisely followed the example set by other forest owning provinces, by the dominion, and by the national government of the United States.

That the extension of time would have resulted in a very great addition to the amount of the commercially valuable timber held under

license was not to be anticipated, in that the bulk of such timber was already so held. At least this is believed to be the case by those in a position to best know the actual situation by personal observation. However, be that as it may, the extension asked for can now have no such effect, even if the province were "one vast unbroken forest from the 49th parallel to the Alaska line," as one dreamer recently expressed himself.

No doubt ultimately the "reserved" lands will be so handled that their product of mature timber will be available for their part in the maintenance of our future lumber industry. The government can, of course, think out at their leisure how this can best be done. One fact, however, must not be lost sight of in the development of the future policy of the province. Whatever form that policy may eventually take, to be effective in conserving and developing the provincial forest resources, it must centre round the timber held under special license which, broadly speaking, constitutes the chief reliance of the lumber industry for its future supplies of raw material.

OBITUARY.

HECTOR M. MACLEAN

With the passing of Hector M. MacLean, pioneer lumberman of the Ottawa valley, there has vanished one of the picturesque figures of the industry in that district. Deceased was widely known, having been connected during his long business career with several lumber firms operating on the Ottawa river. For many years he was a member of the firm of MacLean & McAllister. Fifteen years ago he retired from active lumber manufacturing, but never lost interest in the industry.

The late Mr. MacLean was 70 years of age, and was a native of Glen-garry, his father being the late Captain Donald Charles MacLean. The young man left his native province early in life, engaging in the lumber industry in Eardley Township, Quebec. He was for twenty years Mayor of Eardley, for five years Warden of the County of Ottawa, and for two years Mayor of Quyon. In 1891 he entered the field as Conservative candidate for a seat in the Dominion House, but was defeated by a small majority.

Upon retiring from the lumber business, Mr. MacLean went to Quyon, where he established a flour milling trade, which he subsequently sold to the Dowd Milling Company. He then resided in Eardley for a few years, ultimately removing to Ottawa, where he remained for the six years before his death.

Mr. MacLean's first wife was Miss Annie McAllister, a few years after whose decease he married Clarissa McAllister, widow of the late Robert John McAllister. She still survives him. He leaves four brothers—Messrs. Archie, agent for the J. Lumsden Lumber Company; Henry, of Eardly; Lochie and Alexander, and one sister, Mrs. Catherine Stewart, in the United States; two sons, W. B. MacLean, of Brockville, formerly of North Bay, and Duncan, of Cranbrook, B.C.; also three daughters, Mrs. McFarlane, in California, and the Misses Clara M. and Katie S., of Ottawa.

The funeral in Ottawa was attended by many prominent citizens, after which the remains were conveyed to Eardley to repose amid the surroundings of his early and middle life.

JAMES T. SHEARER.

By the death of James T. Shearer, who succumbed to heart failure on January 7 last, Montreal business circles have suffered a severe loss. Deceased was the son of the late James Shearer, and was born in Montreal July 31, 1853. At about 18 years of age he entered his father's business, where he progressed steadily until he ultimately became its head.

Besides occupying the presidential chair of the Shearer, Brown & Wills Company, Limited, lumber merchants and manufacturers, deceased was also president of the Jacques Cartier Pulp & Paper Company. He was also a member of the Board of Trade, the St. James Club, Engineers' Club, Royal St. Lawrence Yacht Club, and Forest and Stream Club, and has always taken an interest in aquatic sports.

Mr. Shearer leaves a widow, one daughter and two sons, Mrs. Sydney Ball and Messrs. James G. Shearer and G. W. Shearer.

Dr. Creswell Shearer, of London, England, and Mr. Andrew Shearer are brothers of deceased, while his sisters are Mrs. Hugh Watson, Mrs. William Costigan, Mrs. Wood, wife of Dr. Wood, Chicago; Mrs. David Williamson, and Mrs. George Walker.

THE WILDS OF NATURE

Before the Canadian Club at their luncheon on Monday afternoon, January 6 last, Mr. Cy Warman, the noted American author and journalist, delivered an address on "The Protection of the Wild and the Things of the Wild." To those interested in forestry the author's statements were of peculiar interest and displayed a considerable grasp of Canadian lumbering conditions. The address was in part as follows:

"The saddest story in the history of the United States, save that of the Civil War, is the story of the West; and the saddest chapter is the one that tells of the wanton waste and utter destruction of the wild life of that delightful land.

"In the wake of the trail-blazers and road-builders came the adventurers and alleged sportsmen, galloping beside the clumsy cattle of the plain, caribing them and killing them for their tongues, and sometimes merely for pastime.

"And by the time the pathfinders had dragged their chain to the sundown sea, the builders had bridged the continent, and the first flag stations began to dot the desert of the far West; in short, when the

CY. WARMAN, AMERICAN AUTHOR AND JOURNALIST.

white man had opened the first steel train to the Pacific, there was not a living thing worth mentioning in rifle range of the right of way.

"Out of this carnage came the sentiment which found expression in that remotely humorous saying, 'A llood Indians are dead,' to which the Redman, through one of the interpreters, replies,

The Whiteman's blood is pale and cold
The Redman's blood is red,
And, like the Redman, I've been told,
He's good man—when he's dead.

The Redman opens up a game,
That no man knew about,
The Whiteman jumps the Redman's claim,
And rules the Redman out,
No doubt—
He rules the Redman out.

"The Redman, like the red deer, had no rights that the average Whiteman of that tempestuous period felt called upon to respect.

NOT SO IN CANADA.

"Killing Indians was never a popular pastime in Canada. There's no open season for 'Injuns' up here. Also the northern Indian is, by my measurement, a better Indian than his red brother to the south. At the

risk of shocking some of you, I am ready to say that he is a better man in more ways than one, than his white brother—north or south. However, that's a different story.

"Let us return to the other animals. The point I am aiming at is that what is known as the middle West was the natural home of the deer; the elk, the antelope and all that interesting hoofed and horned family, and that all this beautiful, not to say valuable, wild life was wasted. The American West is almost empty of wild life to-day. I have ridden for days in Southern Colorado hearing only the hoof-beats of my horse, and seeing nothing more attractive in the way of animal life than a horned toad.

"For you, of Canada, this wind that put out the life of the American West, is not an ill wind, for it has enhanced the value of your wilderness. At the same time it has taught you, if you care to have it so, a valuable lesson—to hold what you have.

"But first of all you must save the shelter. The forest is the natural home of big game. Destroy your forests and your game will go, your rivers will dry up, your fish will die, the desolation will brood over this land that God made most fair.

"The preservation of the forest need entail no expense to the State. There are forests in Switzerland that have been cut over 400 years, and the animal revenue increases as the years go by. The old saying that you cannot have your cake and eat it too does not hold good here. By scientific lumbering you cut out the old trees and encourage the young ones. It would be almost as foolish to let your forests go to waste uncut as to allow them to be lumbered wastefully. Work them, and reap the rich reward, but work them up in Canada.

"If I want to steal your stories and sing your songs, it is only fair and decent for me to come over and burn a Canadian candle while the wheels go round. If an American manufacturer wants to work up your raw material, compel him to come across. The idea used to prevail that the big plant came to Canada for cheap labor. That is not so to-day. The International Harvester Company pays precisely the same scale of wages in Hamilton and Chicago, and still saves thirty cents on the first cost of producing a certain machine in Canada. Whatever the answer to this, it is certainly no reflection upon Canadian workmen.

"Speaking now as a Canadian to Canadians (I'm at least a half-breed), I say let Americans and American capital come and assist in turning to account the rich resources of the Dominion, and in developing your country, but let them do their developing above the boundary; there should be no striking below the belt.

"Quebec would do well to follow Ontario's example," said Mr. Warman, referring to the wisdom of the regulation requiring American lumbermen operating in Ontario to manufacture on this side of the border. President Roosevelt, he said, had earned the gratitude of the nation by his enthusiastic work for the preservation of American forests.

PULPWOOD AND TIE-TIMBER.

"Having solved the sawlog problem, you will have to do something soon to protect your pulpwood and tie-timber. You own railways—national and provincial; you are paying forty cents for ties that could be had three years ago for 20 cents, because of the American demand, and instead of diminishing the demand is increasing, for there is no panic on this continent—only a slight attack of commercial hysteria, aggravated by the approach of a presidential election. Up here it's a sort of 'sympathy strike.'

"Certainly it is good business to cut and market your merchantable timber, but the cutting should be done intelligently, and all brush and debris burned as the cutting proceeds, which reduces the danger from forest fires.

"Limits that are sold are sold. What has been done is done—but from this day forward there will be no excuse for any government that sells timber without reserving its right to boss the job of cutting.

"Hear this from an American publication, 'Forestry and Irrigation,' Washington, D.C.:

"It is very much to be hoped that the Canadians will not allow us to cut their timber without regulation, however eager we may be to buy it. This would be for their benefit, and likewise for ours. For the sake of a permanent supply, we should wish that Canada or any other country from which we may have to import lumber should put its forests under the same careful administration that now is given to the National Forests in the United States."

FOREST AND GAME PRESERVES.

"Broadly, there are two kinds of lands in Ontario—land fit for settlement, and land fit for forests. All you have to do is to spy out, survey and separate these lands and they will all yield rich returns. The Crown forests of Saxony yield \$4.50 per acre per annum, despite extravagant, semi-military management. Ontario should have at least 50,000,000 acres of forest and game reserves. Some of these should be game havens, like Algonquin, some open to the sportsman, as Temagami. Mr. Southworth estimates that 40,000,000 acres of forest would produce \$30,000,000 net annually.

"Up in the northwest corner of Thunder Bay, north of Lake Nipigon, south of Lake Joseph, and east of the Rainy River district, lies a great stretch of wilderness which should be set aside immediately as a forest and game preserve.

"And when you have established these forest reserves, try to attract some of the millions that are spent in Maine.

"In 1906 you sold 411 shooting licenses, at the old and by no means low price of \$25, yielding a revenue to the province of \$10,275. Last year about half that number at \$50, realizing from this source the same amount, \$10,275.

"As near as I can come at the facts, just about the same number of deer were killed, you got no more revenue, and lost 205 1-2 sportsmen who would have spent riding in the railways—including the T. & N. O.—in your shops and hotels, at the lowest calculation, \$50,000. Now, there must be, somewhere, a real reason for depriving the province of this rich revenue, but it'll have to be shown."

Continuing, he contended that the license should not be higher than \$15, as in Maine.

Fortunately, for the people of the Republic, Eastern States are beginning to protect game. They find it pays. The forest, fish and game of Maine yield a rich revenue to the State. Half a million men, women and children visit Maine annually, leaving fifteen million dollars each year. They go to Maine because the forests are full of wild life, and because one may fish and shoot from early autumn to the end of the year for \$15. I am told that ten years ago no deer were seen in Western Connecticut. To-day, as a result of a few years' protection, you can pick up the fresh trail of the deer, four-legged and properly spelled, forty-five minutes from Broadway.

"The red deer, at his worst, is semi-domestic. The natural home of this interesting animal is south of Temagami, but, if you do not call off the dog, you'll drive him far north, where he will perish. Dogs mean wild deer, few and far between, and dry does. Maine has proven that dogs, rather than cheap licenses, reduce the number of deer. There are more deer in Maine to-day than the woods can winter, and they are coming across to Canada.

EARTH'S HAPPY HUNTING GROUND.

"Canada is earth's happy hunting ground. I believe the greatest measure of happiness comes to the people of comparatively cold countries. Four seasons are essential to the proper rounding up the year. Here in Canada the zest and novelty of winter is not warm when you begin preparing for the holidays, and, by the time you have digested your plum pudding, you begin the joyful anticipation of spring. Then the 'Indian' in us calls loud.

When the first black crow is calling in the dawning down the dell,
I am dreaming of the summer. In my dream
I can hear the mudzekeewis sighing softly, I can smell
A wild rose blooming near a northern stream:

I am waiting in my wigwam for the coming of the spring,
For the forest flowers to blossom in the vale.
I am watching from my wigwam for the wild goose on the wing,
When I'll gather up my traps and hit the trail.

To the "Highlands of Ontario" in the merry berry-moon,
To the Haunts of Hiawatha that are nigh:
By the banks of Athabasca where it's always afternoon,
I am waiting for the Wawa to go by.

"I do not agree with the late Russell Sage, who would have no holiday. The fact is his whole life was one long holiday, for he found his highest enjoyment in hearing his bonds multiply. He thought he needed

no holiday because he lacked the capacity to enjoy one. Perhaps he was better off financially without a holiday. If he had seen the fish frolicking in Temagami he could not have skinned 'suckers' so cheerfully. If he had heard the 'Call of the Wild,' gone into the wilderness and looked a fawn in the face, the bleat of a shorn lamb would have distressed him, so he denied himself, poor, selfish soul, and never knew how much he missed.

"A man is always better for coming in contact with nature. To be utterly alone in a desert when the dark comes down is awful, but inspiring. To stand alone in a deep forest is to feel things. It has made a man, not deeply religious or over sentimental, exclaim in a breath:

By day I walk the woodland green
And come so close to God,
His answering signals may be seen
In each wild rose's nod.

"One of the best signs of the times is the awakening of all America to the fact that this continent must not be shorn, that the rivers must be allowed to continue to sing their songs, and that the furred, feathered, hoofed and horned things shall not perish and fade from the face of the earth. The voice of Nature is your mother tongue and you won't forget. A touch of nature makes a man of a boy and a boy of a man. It puts a new song in your mouth.

"Only last summer your North woods caught and held for ten glad days a dozen Chicago newspaper men, authors and poets, charmed and delighted them, and sent them out singing:

Crystal Temagami, Wasacsinagama,
Low waves that wash up the shadowy shore,
North up the Nipissing, up the Temiskaming,
We will come back and sing to you encore;
Back to the wilds again, show me the way,
Make me a child again, just for a day.

Wondrous Temagami, Wasacsinagama,
Swift running rivers and skies that are blue;
Out on the deep again, rock me to sleep again,
Rock me to sleep in my little canoe;
Back to the wild again, show me the way,
Make me a child again, I want to play.

"No acre of forest should be mown like a meadow, leaving a hateful stubble of stumps. Many of the once wooded mountains of Italy are barren hills to-day, because when the forest was all removed the rains washed the soil away, making reforestation impossible. From the car windows as the train toils up to Jaffa and Jerusalem the traveller looks out on a sear and silent land.

By cool Siloam's shady rill,
How fair the lillies grow.

"What a pretty picture! Alas! the shade has been removed, the rill has ceased its singing, the lillies have drooped and died, and that is what will happen to the Highlands of Ontario and your beautiful Laurentian hills if you do not protect them.

"Your property is being destroyed, not maliciously, but carelessly, and the result is the same. Protect your forest while you have it, for when it is gone you will be utterly helpless.

"Your's is the last great wild, and if you squander it your children's children will sit in the sun beside silent streams that are murmuring musically to-day."

URGE EXPORT DUTY ON PULPWOOD.

Hon. J. D. Rolland, of Montreal, president of the Canadian Manufacturers' Association, was in Ottawa on January 11 interviewing Sir Wilfrid Laurier and other Ministers to urge that Government legislation be introduced this session providing an export duty on pulpwood, and making more adequate provision for conserving the forests of Canada, on which largely depends the preservation of the splendid water powers of Ontario, Quebec and New Brunswick. The Canadian Manufacturers' Association intend to continue urging this question upon the attention of Federal and Provincial Governments until adequate measures are taken to attain the end in view.

Sir Wilfrid expressed his entire sympathy with the views voiced by Hon. Mr. Rolland. It is probable that a Royal Commission will be appointed this session to take up the whole question of forest preservation, and the concomitant question of prohibiting the export of pulpwood.

JOSEPH OLIVER, TORONTO'S CHIEF MAGISTRATE.

By the largest majority ever accorded a mayoralty candidate in that city, Mr. Joseph Oliver, head of the Oliver Lumber Company, was on January 1 last elected Mayor of Toronto. The total vote polled for Mr. Oliver was 14,003, his nearest opponent securing only 7,162. The election is an exceedingly popular one, not only among the lumbermen of Ontario, by whom Mr. Oliver is well known, but by the citizens of Toronto and people of Ontario generally. Perhaps in no previous year had popular interest in a Toronto mayoralty contest waxed so warm.

By those who know Mr. Oliver best his term of office promises to be one of unusual activity. In his younger days it used to be said of him: "He would rather sell lumber than eat his breakfast," and to-day his enterprise is scarcely less pronounced. In the old days some of his customers, who had been charmed into buying what they did not want, predicted that his dying words would be: "Shall I send you that car of lumber?" This furnishes an apt illustration of the characteristics of a man whose career as lumber salesman in an age of keen business compe-

JOSEPH OLIVER, MAYOR OF TORONTO.

tion was marked by a thorough knowledge of his business in all its phases.

Toronto's new Mayor was born in the village of Erin, in the county of Wellington, but he moved to Toronto when very young, so that practically all his life has been spent in the city whose affairs he has now been called upon to direct. He was educated in the old Park public school and afterwards served an apprenticeship to the carpentering trade. About 1872 he entered the employment of the late S. R. Briggs, the pioneer wholesale lumber dealer of Toronto. Upon that gentleman's retirement in 1877 he, together with Messrs. T. S. McCool and John Donogh, formed the firm of Donogh, McCool & Oliver, and continued the business of S. R. Briggs with marked success. In 1883 Mr. McCool withdrew, the firm continuing business as Donogh & Oliver. The business grew apace and branches were established at Buffalo and Tonawanda. Trade reverses, however, at last caused a dissolution of the firm. Then in 1897 the Oliver Lumber Company was founded, with Mr. Oliver as its president, which position he to-day occupies.

For over twenty years he has been actively connected with municipal affairs in the city. In 1885 he became member of the Public School Board, and after three years' service was elected a High School Trustee.

His entry into the City Council was made in 1895. After one year's service he left the city for a time, but returned to the Council in 1901 and served as an Alderman until the end of 1903, and as Controller in 1904. In 1906 he was again an Alderman, but retired at the end of that year.

In fraternal and kindred societies he has wide connections. He is a Past Grand Master of the Oddfellows, a Mason, a Forester, a member of the Granite Club, National Club, Toronto Canoe Club, Kew Beach Bowling Club, Royal Templars of Temperance, and a life member of the Toronto Board of Trade. He is a Past Master of McKinley Lodge of Orangemen. He has been thirty-five years an Orangeman and an Oddfellow. In addition to these positions he is vice-president of the Commercial Travellers' Mutual Benefit Society, and chairman of the Board of Managers of Old St. Andrew's Presbyterian Church.

A HUNDRED MILLION TIES A YEAR.

In the construction of new track and for renewals, the steam and street railroads of the United States used, in 1906, over one hundred million cross-ties. The average price paid was 48 cents per tie. Approximately three-fourths of the ties were hewed and one-fourth sawed.

Oak, the chief wood used for ties, furnishes more than 44 per cent., nearly one-half of the whole number, while the southern pines, which rank second, contribute about one-sixth. Douglas fir and cedar, the next two, with approximately equal quantities, supply less than one-fifteenth apiece. Chestnut, cypress, western pine, tamarack, hemlock and redwood are all of importance, but no one of them furnishes more than a small proportion.

Oak and southern pine stand highest in both total and average value; the average value of each is 51 cents. Chestnut ranks next, followed by cedar. Hemlock, at 28 cents, is the cheapest tie reported.

More than three-fourths of all tie are hewed; and with every wood from which ties are made, except Douglas fir and western pine, the number of hewed ties is greater than the number sawed. Of the oak ties a little over one-sixth and of the southern pine ties less than one-third are sawed. In contrast to the southern pines is the western pine, of which more than one-half the ties are sawed. In general, when lumber has a relatively low value the proportion of sawed ties increases, because the market for ties is always active, while that for lumber is frequently sluggish. All western species are affected by this condition, for stumpage is abundant and its value relatively low.

Ten per cent. of the ties purchased were treated with preservatives either before they were purchased or at the treating plant of the railroad company. At least ten railroad companies are operating their own plants for the preservation of their construction material.

Of the many forms in which wood is used, ties are fourth in cost, sawed lumber being first, firewood second, and shingles and laths third. It has been calculated that the amount of wood used each year in ties is equivalent to the product of 600,000 acres of forest, and that to maintain every tie in the track two trees must be growing.

With nearly 300,000 miles of railroad trackage and approximately 2,800 ties to the mile, there are over 800,000,000 ties constantly subject to wear and decay. The railroads report that in the form of ties cedar lasts eleven years, cypress ten years, and redwood nine years. These woods, however, lack the desired weight and hardness, and, what is more important, they are not available in the region of the trunk lines of the Central and Eastern States. When it is considered, then, that the service of the longest-lived tie timbers in general use—chestnut, white oak, tamarack, spruce, and Douglas fir—is but seven years, while with some, as the black oaks, it is but four years, whereas a treated tie with equipment to lessen wear will last fifteen years, it is apparent how much the railroads can save if preservative treatment of ties is universally adopted. The saving in the drain upon the forests is of even greater moment.

Details of the consumption of ties in 1906 are contained in Circular 124, just issued by the Forest Service in co-operation with the Bureau of the Census. This pamphlet can be secured by application to the Forester at Washington, D.C.

Lumbering in New Brunswick*

By CHAS. MCINTYRE

Illustrated by Lumbering Scenes on the Miramichi †

There is no doubt that the average size of the logs which, cut on the St. Francis, the Tobique, the Aroostock and other branches of the St. John, are each spring driven down the river to the mills, has been for a decade past growing slowly less. Logs of such dimensions that ten years ago they would have been considered too small and would have been left standing, would at the present time be cut down and forwarded. This is merely an indication of the ideas of those who have the cutting privileges or as it is technically known, who "own the stumpage."

A redeeming feature of the situation is that, while for several years the tendency seemed to be to cut anything that would make lumber no matter how small, there has been apparent during the past year a strong feeling in favor of cutting only the larger logs. The cut of logs of the winter of 1906-7 would average better in size than those of several preceding seasons.

This attitude on the part of those who control the sawlog industry would at once suggest a remedy for the threatened evil of lumber scarcity.

Even though only the larger trees were cut and the smaller ones left to grow, the output of lumber each year might still be a tremendous

one. But, in any case, no matter how unbridled the lust for the big trees and the money they will bring, it will be many years before the scarcity will be actually felt. And there can be no such word as extermination used with correctness in this connection; so long as our soil is rich, so long as the sun shines, and the rain falls the trees will grow, the shoot of to-day will be a sapling to-morrow, and the sapling of to-morrow will be a sawlog a few years hence. Curtailment of the volume of logs cut is the curse; the big logs only must be cut, the immature trees left to grow. The less desecration used this year in the quantity of logs cut, the greater the scarcity that will come and the longer the period of that scarcity. The men who own or hold leases of lumber lands are no doubt waking up to this fact, are leaving the smaller trees to grow, and are using every means in their power to make the supply of logs for the coming years as near a certainty as may be.

Year by year steps are being taken to offset and reduce the menace of the forest fires. Regulations which require the owners and lessees of lumber lands to have such lands patrolled is one of the most important steps taken in this direction, and one that is being strictly enforced.

CEDAR SHINGLE INDUSTRY.

The cedar shingle industry takes a very important place in the manufacture of lumber throughout the province. This line of goods

has won for itself an enviable reputation in the markets of the United States. The principal distributing point for the trade is Boston, and the quantity of shingles dispatched thence from this port each year is tremendous. During the last decade the demand in Boston markets has run almost entirely to higher grades. "Extras" and "Clears" form the nucleus of the demand, the lower grades, "2nd Clears" and "Ex No. 1s" are not much desired, and to dispose of these lines, the manufacturers must depend upon provincial trade.

The American markets are an important factor in the disposal of

certain grades of spruce long lumber. Such lumber of any sort which is cut on American lands, even though it be manufactured in a mill viding the mill at which it is sawn is owned exclusively by one or more American citizens. This means a saving of the duty on long lumber of \$2 per thousand, superficial feet, of 30 cents per thousand on shingles, and 25 cents per thousand on laths.

Spruce deals intended for shipment to the United States are sawn into deals of the following dimensions: 3 x 6, 3 x 8, 3 x 10 and 3 x 12.

Lumber for shipment to Australia must be dry; that is perhaps the most essential difference between it and "English," as the deals for standing on Canadian soil, may go into the United States duty free pro-shipment to England are known. The sizes are practically the same.

South American shipments must also be dried. The greater portion of the demand is for boards and scantling. The dimensions of the usual cargo are as follows: 1 x 3, 1 x 6, 1 x 12, 1 1-2 x 12, and 2 x 12, all from 12 to 16 feet long, with at least 50 per cent. of the latter length, also 2 x 3, 3 x 3, and 3 x 4, 12 feet and up in length. These South American

* Abstracted from article in St. John, N.B. "SUN".
† From the annual report of the New Brunswick Forestry Convention for 1907

shipments, like the English and Australia, are made up almost entirely of spruce.

Cargoes destined for South Africa are much like those consigned to the English market except for the fact that South African dealers will take a greater number of pieces less than ten feet in length, known as ends.

The cargo destined for the Irish market calls for the very best that is to be had. Stock that might be described as ordinary will not answer, only the very best grade will be accepted for the Irish trade. The piles at the mills are culled and sorted in order to get the goods that will qualify and the result is that these consignments are worth a great deal of money. The sizes are practically the same as those of "English" specifications.

In the lumber trade of the year just ended the most prominent characteristic has been a lack of stimulus in the most important lines. This period of depression, which began early in the spring of 1907, followed a long period of stimulation, brisk demand and prices that in some cases might be called abnormal.

As before stated, the most vital element in the lumber trade as it

concerned, and this means of course that the year has been an "off" one, the other lines, while important, being a small consideration in comparison with the deals.

Any prophecy or forecast of the situation would be nothing more than a guess. Neither the American or English markets are showing much signs of life.

During the winter season little change is looked for, any developments of a more favorable nature would not materialize until the opening up of the spring trade.

The effects of the dullness of the season just past are of a far-reaching nature. One important effect is shown by the fact that the volume of logging operations on the St. John and its branches during the present season will not total to more than half the total volume of last winter's cut. Local lumber manufacturers do not propose to be tied up next year by having a too great quantity of logs on hand, and it is probable that the sawing season of 1908 will be shorter than has been the case for a decade.

The trade in spruce lath, while not up to last year either in prices or demand, has been fairly brisk, and the prices obtained have been about

affects the local industry is in connection with the spruce deal trade in the United Kingdom.

The conditions of the English market have for several years been of such a prosperous nature that the chief aim of lumber manufacturers had a tendency in but one direction, that aim being at all hazards to ship as much lumber in the United States as has, like the larger saw cuts, larger shipments and heavier offerings were the natural results. For a long time the demand held and prices remained firm, even in the face of the tremendous inpouring of lumber.

But last spring the slump came. The demand slackened somewhat, the markets were glutted, the eagerness of dealers to dispose of heavy stocks brought the natural result, and prices went with a crash. All through the spring, summer and autumn the depression in the English market showed no sign of change. Consignments of such dimensions and quality that they would have sold at St. John for \$14 to \$14.50 in 1906 would not have brought more than \$12 to \$12.50 during 1907.

Local dealers have been advised repeatedly to curtail their shipments and have followed instructions as far as possible in this respect.

The market for New Brunswick long lumber in the United States has, like the English market, been lacking in snap all through the season. Of course this condition is not so important to local lumber people as is the case with the state of the English markets, but the volume of shipments is considerable and the lack of demand is keenly felt.

On the whole the year of 1907 has been a disappointing one to local lumber dealers and manufacturers so far as the sale of long lumber is

the average. While prices in this line are off a shade just now, the goods have brought on an average about \$2.25 per thousand at St. John for the dutiable article.

The year in high grade cedar shingles has been one of phenomenal prices. When sales were made in Boston at \$4 it was thought that the highest point had been touched and that a slump was about due. To the surprise of all concerned, prices held month after month, and lately reached the unprecedented figures of \$4.25 for "Extras" and \$3.75 for "Clears" at Boston. Shipments of cedar shingles from this port during the year have been heavy, and few of the high grades are offering.

SEEDLINGS FOR RAILWAY TIES.

Fifteen thousand catalpa seedlings have been received by the Toledo, Peoria & Western Railway to be planted in various groves along the line of that road, the wood when grown, to be used for ties. The seedlings were purchased in Kentucky and were shipped in bundles of one hundred each.

Three towns along the right of way, Cruger, Rewaits and La Harpe, will be given the first consignment of the young trees. They grow very rapidly and in five years will be large enough to furnish ties. Catalpa wood is very tough and when seasoned properly will last a long time.

It is hoped to reduce the expense of ties materially by this plan. It will also have the effect of reducing the destruction of American forests.

MARKET CORRESPONDENCE

TRADE IN EASTERN CANADA.

St. John, N.B., Jan. 10, 1907.—The most conspicuous feature of the lumber industry at present writing is the discouraging outlook for the getting out of logs. The winter so far has been one of a probably unequalled continuance of mild weather. Not once has the mercury reached zero in this city or the immediate vicinity. Early in December there were a few inches of snow, but this lasted only about a fortnight, and for the last three or four weeks the ground has been as bare as is the case in the summer season.

The ice in the rivers and lakes is unfit for heavy traffic, and in many cases detours must be made by the logging teams. Conditions are decidedly unfavourable to logging contractors, and no doubt many of them will make heavy losses, not only in the lower counties, but in far up-river sections. Throughout the whole southern section of New Brunswick affairs have reached a crisis. Logging crews are being reduced each day and in several cases operations have ceased entirely. Portable mills, too, are badly handicapped because of the lack of snow, and during the week three plants of this class in Saint John County have closed down. On the Tobique, the St. Francis, the Aroostook and other up-river branches of the St. John, the lack of snow has been felt only during the last few days. The three or four inches of snow which cover the ground in these sections answered amply for the yarding of the logs, but, now that the time for hauling them to the brows has arrived, the lack of snow will mean a crippling of operations. Also, there is no doubt that chopping and yarding operations have been curtailed somewhat because of the strong probability that large quantities of the logs must be left on the yards.

The effect of all these conditions upon the local manufacturers will be easily seen. Having already curtailed their logging contracts to 50 per cent. of the usual, because of the existing conditions of the trade, the present unfavorableness of conditions will be all the more apparent in its effect upon the output of the local saw mills during the sawing season of 1908. Conditions in the southeastern portion of Quebec, and particularly that portion which borders upon the St. John river and its branches, are such as have not been equalled in a generation. On the Restigouche, the Nepisiquit, the Miramichi and other north shore sections similar conditions are reported. Frost and snow are badly needed in all directions in order that logging operations may not be a complete failure.

CONDITIONS IN THE OTTAWA VALLEY.

Ottawa, Jan. 10th, 1907.—Sales among Ottawa valley lumbermen are rare, the chief work among them being stock-taking. The quietness has not, however, affected prices. Odd lots from country mills have been sold at cut rates, the quality being largely hemlock and spruce of indifferent manufacture, but the standard grades of lumber are all quoted the same.

While January is always a quiet period, the condition is unusually so at the present time. No large English or American buyer has made an offer yet for any of next season's output in the Ottawa valley. It is understood they are holding back for a change of price.

While it is difficult to state anything definite on the subject it looks as if the Ottawa valley saw mills would make more deal this year than formerly. This would be done to provide against overstocking the American market. The falling off in orders from the United States indicates that the buyers need to be relieved somewhat. It is, at least, not expected that they will be keen enough to push the prices up on the British buyer.

The consensus of opinion among the local lumbermen is that the mills will not cut so much as usual in the summer of 1908. The smaller manufacturers would not have the supply of logs to do so, owing to the general shrinkage in the quantity of logs cut this winter. The mills in the immediate vicinity of Ottawa have too many logs ahead to be affected by the shanty operations in progress, but they are likely to be influenced by the money stringency.

The dam that will be constructed across the Ottawa river at the Chaudiere, as a result of the settlement of the old contention among

the water power owners, will not be commenced for nearly a year. The improvement has to be built when the stream is at its lowest in order not to add unnecessary cost to a work which will entail a large expenditure for the lumbermen. Just how much the dam will cost none of the capitalists involved in the scheme are yet prepared to say.

From 20 to 30 per cent. more power is what the owners expect to derive from the falls when it is equipped with a new dam. They depend on the Dominion Government to build many more works in the Upper Ottawa, which would further increase the value of the cataract. The Government works would also help navigation and regulate power along the river.

Men who know the river assert that the next season does not promise well for the building of the dam, as there is likely to be very high water most of the year. The most suitable time to commence will likely be August.

J. R. Booth and the E. B. Eddy Company, lumber and pulp kings, will derive the most benefit from the agreement, owing to the extensive and continuous nature of their work. The men who signed the agreement are: T. Ahearn and J. D. Fraser for the Ottawa Electric Company; G. H. Millen and W. H. Rowley for the E. B. Eddy Company; W. C. Edwards and Russell Blackburn for the Ottawa & Hull Power Company; E. H. Bronson and L. Crannell for the Ottawa Power and the Bronson Company; J. R. Booth, T. Ahearn, W. Y. Soper, L. Crannell and E. H. Bronson, representing individual interests; J. S. Chamberlain and Peter Whelen, for the Ottawa Investment Company; J. I. McCracken for the Lumsden Estate; T. Ahearn and H. H. Williams for the Ottawa Land Association.

The settlement of this question was followed on January 8 by the visit of a large deputation to the Prime Minister and Minister of Public Works, asking that the Government undertake the conservation of the head waters of the Ottawa river, and stating that the agreement among the Chaudiere power owners would not be executed until Parliament voted \$160,000 for the impounding scheme. Messrs. J. R. Booth, W. H. Rowley of the E. B. Eddy Company, G. B. Greene of the Upper Ottawa Improvement Company, and James Davidson (also representing the city as controller), united in the demand for Federal assistance, and succeeded in getting the promise of favorable consideration from Sir Wilfrid Laurier.

Hiring of shanty men has almost dwindled to nothing; a few are needed, however, to complete gangs, and these are paid from \$18 to \$24 per month.

NEWS FROM THE COAST PROVINCE.

Rossland, B.C., Jan. 9., 1908.—The Action of the Provincial Government of British Columbia in its decision not to issue any more timber licenses, is already bearing beneficial results in establishing a permanent and increasing value on licenses now in force. It is creating a marked interest, especially among the lumbermen on the United States side of the line, who have large holdings in this province. In the brief period in which the reserve has been in force, inquiry for British Columbia timber has been brisk, and a Spokane syndicate has incorporated, under the title of the Universal Lumber Company, capital \$500,000, for the purpose of operating near this city, and of acquiring limits now held by license.

In view of the depletion of the timber resources of Eastern Canada, as well as of the Eastern and Southern States, the Government deemed their present move advisable, and Premier McBride states that it is the intention of the chief commissioner to have the forests as thoroughly protected as possible. Coast lumbermen, who operate almost entirely on licensed timber lands, feel that the licenses now in force have increased practically twofold by reason of the reserve. The licenses run for a period of twenty-one years, and have a further value in that the holder has first call on the purchase of the land. West of the Cascade range, the fee is \$140 per year for each square mile, and east of the Cascades it is \$115 per year. A royalty of 50 cents per thousand on all timber cut, and reckoned from the output of the mill, also goes to the Government.

This gives a marked advantage to license holders of Government land, as against land acquired from the Canadian Pacific Railway. The railway company hold immense tracts, but realize the coming value of timber, and are indifferent about selling. They exact a royalty of 50 cents, and one must accept and pay for the quantity as cruised by the

company or leave it. This gives a distinct advantage of \$2 per thousand to the holder of licenses.

The chief activity, at present, centres on the large tracts of timber along what is known as Sheep creek, across the international line from Stevens county, Washington, and on the North Fork of the Kettle River, in the Boundary district. The latter is being sought because of the announcement that the Kettle River Valley Railway, which has this timber, is to be extended to Spokane, and will be electrified. All the timber in the northern part of Stevens county, Wash., and tributary to Sheep creek, is now held or controlled by a large American company.

Much activity exists at present in getting out ties for the Grand Trunk Pacific Railway, and 200 men are engaged in this work along the north fork of the Kettle River. These ties are bringing from 35 to 45 cents apiece.

The pole industry is not so active as it was a year ago, but a number of camps are in operation. The timber, especially, along Sheep Creek, covers the entire valley, and is about 70 per cent. cedar. Some of these sections will go sixty thousand to the acre, making one of the largest tracts of cedar in Southern British Columbia.

POINTERS IN PLANER PRACTICE.

Did you ever ask the question and try diligently to find a satisfactory answer as to what constitutes good planing mill work?

There are too many planing mill men who think the correct answer to this question is to be found only in a large planing mill with heavy and expensive machines. There are probably many operators of small planing mills in country towns with only a few light machines who envy their big brothers in the city and think that there is no need to try and compete with them so far as good planing mill work is concerned, because their plants are overshadowed in magnitude by the city planing mill with all its modern equipment. Because he thinks this way, many a man operating a small planing mill doesn't get as good work out of his mill as he should, because he fails to realize its possibilities. The real truth of the matter is, as you will find when you investigate the subject thoroughly, that it is not the magnitude in planing mill equipment which puts the quality into the work, or does what might be termed good planing mill work. Every mill, no matter what its size, is made up of individual machines, and every individual machine, large or small, is the same machine, and will do the same work in a small plant that it will in a big one. All it needs is the same attention.

All of this, and a lot more, might be said to open the eyes of some small planing mill men in the country and put them in a more receptive mood for pointers in planing mill practice which might enable them to better understand the possibilities of the machines they have along the line of doing good planing mill work. Too many think that there is no need to try to turn out work which will compete with the larger mills, because they have not the large equipment and because they think it is no use, rather than because of any lack of equipment or ability; such men fail to put forth their best efforts, and consequently do work that is not as satisfactory to themselves as it might be. This kind of reasoning is too much like the despairing soliloquy of the rooster in saying, "What's the use? Yesterday we were eggs and to-morrow we are feather dusters."

Did it ever occur to any of you who feel and reason in this "What's when one wants to put real quality into the work. This argument may the use" way that frequently the big planing mill or other large institution will turn to the small and simple machines to get quality into their work and do the best class of planing mill work? If it didn't you have a thought coming that should put some new ideas and some fresh spice into your work, because they do those things and frequently it is the smaller machines and planers that are made use of to do the highest grade work, and also the double surfacer is discarded for the single surfacer start a storm of protests, but it is good just the same and worth taking home and thinking about. A student of machinery and methods in a recent discussion on the subject of the development of woodworking machinery, after telling about the advent of the surfacer, said: "Then came along the man who figured that the under side of a board could be finished at the same time as the upper, and he demonstrated that practically by making a double surfacer. It was only a step to put on side knives to joint or make tongues and grooves, and this is where we stop to-day, because after double surfacing, joining or matching a board,

that is all that is required of a surface machine to do, unless you use it as a surfacing resaw and surface down inch boards to 3-8 inch, when the resaw is out of commission, a thing I knew of being done in a box shop once. The red flag of the sheriff was rung out before many millions of feet were 'surfaced resawed' in that way.

"Every machine man makes his claims and every machine offered does something superior to the other man's surfacer. Strange as it may seem, if the superior points in every surfacer were all combined in one surfacer, that combination surfacer, instead of being a paragon of perfection, very likely wouldn't be worth a damn!"

A specific case illustrating this point was brought out recently in connection with the equipment of a plant to make parquet flooring. This is a class of planing mill work which in some respects calls for a high degree of precision. Good flooring, as we all know, is generally made on heavy, expensive machines, and yet in the equipment of this new plant for making parquet flooring every machine was small, simple and light running. There was not even a double surfacer in the plant, the strips being faced on a single surfacer and the edges jointed afterwards on another simple machine. It was so remarkable, and so different from what one might expect that it excited some comment and some inquiries as to why, and as a result of these inquiries there were obtained some pointers on planing mill practice that seem to be worth while for many of the planing mill men operating small planing mills, either in the country or in the city.

The first point relating specifically to such light small work as the making of parquet flooring strips was that holding it in rigidity for surfacing it on all four sides in the machine involves so much pressure and clamping on all the sides that it takes lots of power to force the strips through, and in case the strips happen to be cross grained or something else, there is danger of it breaking and causing delay and a lot of trouble to get it out of the machine and straighten it all out again. This one point applies specifically to light strips and there are a number of others which apply equally well to planing mill work.

One is that it takes lots of power to operate a big machine and hold the board rigidly for surfacing on all the four sides.

That is, a machine, in addition to the power required for cutting, consumes a lot of power in the friction of the pressure bars and in the power required to feed a board through. Another point and a more important one is better surfacing, better planing mill work, in fact can be more easily done on a single head machine, a panel planer, for example, than on a big double or four-side surfacer. The one cutter head gives you an opportunity to have a rigid platen underneath and simplifies wonderfully the work of holding the board down to the planer while it is being fed through the machine. There are no complications in the way, no need to hold it up as well as down, and any man with mechanical skill and an eye to details can make a single surfacer do good work and frequently, where quality is the main object, it is found better to run a board twice through the single surfacer to dress both sides than once through a double machine. If there is a limited quantity of the work it is better to run twice through the single facer, but if it is a steady stream of work, some place where quality is an object, it is better to place two single surfacers in tandem order and use two single surfacers instead of one double surfacer. This is one of the things that is done in some of the big institutions which is an important point for the smaller planing mill men to take home to themselves, because it brings with it a realization of the fact that the little surfacer in a small planing mill that looks insignificant is really capable, with proper manipulation, of doing better work than most of the big double surfacers in large institutions.

Take the furniture factories and some other manufacturing institutions, and the big double surfacers are used as a sort of receiving or roughing planer, and not much effort is made at getting a neat finish with it. Stock is sized to dimensions enough larger than what is ordered when finished to leave room for doing the final cutting afterwards on the panel planer. Then, after the work is ready for finishing it comes through the single surfacer or panel planer, which is kept sharp and carefully adjusted for smooth work, rather than for speed or heavy cutting.

This line of argument is not offered as a species of fault finding against the larger and more complicated machines. These larger machines, that is the double and four-side surfacers, are made to fill a pur-

pose which many of them fill well, and that purpose is to save time and extra handling of the stock to get two or four sides surfaced at once. Saving of time, however, is one thing and putting quality into the work is another, and without finding fault with any of these larger machines the idea that it is desired to bring out is that many of the planing mill men have in their shops some small surfacers that are not doing as good work as they ought to do, simply because they do not realize the possibilities of the small single surfer and are sometimes kept from realizing them by an erroneous impression that the only way to get good mill work is to have big, complicated, expensive machines and a whole lot of them.

Good work in planer practice might be analyzed and set forth in a formula as 10 per cent. skill and 90 per cent. detail, and that analysis would pretty well cover the majority of cases. There are some who may take a different view and think that the heavier percentage should be skill, but when they get down to it right, skill itself is largely made of attention to details. There are certain elements of thought and manual training which come from practice only, but with due credit to all of this the fact remains that the larger element in good work is that of close attention to details. It begins in the selection of the knives for the planer and doesn't end until the board is finished and delivered. It is not much in itself to select a knife that is not quite up to the grade of some other knife to save a little on the price, and this alone might not seriously mar the work of the planer, but it is a little step that leads to others, and it is the aggregate of these same little steps that, if allowed to accumulate enough, will seriously mar, if not entirely destroy, the quality in planer work.

The man who takes pride and pains in selecting the best planer knife to be had, after thoroughly testing and trying, will naturally take more pains in grinding that knife, and will be careful that he doesn't burn it, will see that he gets the right bevel and perfectly straight from end to end, and when he begins to put it on the machine his pride in the knife and his work will continue to grow on him until it is a dominating factor, and he will take more pains in seeing his knife exactly balanced, and seeing that all the bolts and washers balance, and that they are neatly tightened down, not strained, and he will be more patient and take more pains to see that each knife on the cutter head sets exactly right, so that all will cut the same. By this time his pride in the work and looking carefully after details will have such effect that he will not have to be reminded to see that his cutter head journals are in good order, and that his pressure bar and chip breaker come into position right, and that his planer bed is clean and sets firm and rigid the same distance from the cutter head on each side, and the rollers are high enough to clear the bed, but not enough to make the stock wavy. All of these things will follow in their natural order if he but once starts right, starts out with the idea that nothing is insignificant and every detail is important, and that everywhere the best is none too good. When he does this the work of his little planer, no matter how small, or how simple, will not only compare well with the best work of any mill but best of all it will keep alive in the man pride in his work, which is a great stimulating influence.

About the best advice that can be given is that no matter how old or how simple a machine in your planing mill may be, you can get good work out of it if you but go about the thing right.—American Carpenter and Builder.

NEWFOUNDLAND FORESTRY ASSOCIATION.

A Forestry Association has been formed in Newfoundland, with His Excellency the Governor as patron, and Sir Robert Bond, the Premier of the colony, as president, together with a number of prominent persons more or less connected with the lumber industry as directors. The objects of this association as stated to be:—

(1) To advocate and encourage judicious methods in dealing with our forests and woodlands.

(2) To awaken public interest to the very serious results attending the destruction of our forests by fires and other illicit processes, and to devise and suggest methods for their preservation.

(3) To consider and recommend the exploration, as far as practicable of our public domain, with the view of determining the areas suitable for agricultural settlement and those that may be permanently reserved for the growth of timber.

(4) To encourage afforestation wherever advisable and to promote forest tree planting.

(5) To collect and disseminate, for the benefit of the public, reports and information bearing on the forestry problem in general, and especially with respect to the conservation of our own forests, and to teach the rising generation the value of the forest with the view of enlisting their efforts in its preservation.

CANADIANS SHUT AMERICANS OUT.

Americans have purchased immense areas of timber in British Columbia, but the Canadians believe that outsiders have secured about enough of their forests and have issued an order that places under reserve for an indefinite period all unstaked lands in the province, which includes Vancouver Island, where Americans have been most active. The Canadians for a long time thought that they were getting much the best of the bargain, and were laughing in their sleeves at the way investors were coming across the border to buy their trees. They could not realize the rapid appreciation in timber values that prevailed for three or four years, and which the Americans were quick to take advantage of.

A peculiar feature of the situation resulting from the withdrawal of timber lands is that many small newspapers will be driven out of existence. In heavily timbered and sparsely settled districts, small sheets in numbers thrived merely through the advertising necessitated by the legal machinery accompanying the sale of government timber. As the rate for advertising timber limits is \$2.50 and \$5 a parcel—a parcel occupying from three to seven lines of type—many newspapers were supported without any other source of income, some of them having no more than a few dozen subscribers. Some eight-page papers, published weekly, were earning as much as \$1,800 every issue for their publishers. The law required advertising in the newspapers of the immediate locality.—Mississippi Valley Lumberman.

BRITISH COLUMBIA TIMBER AND FOREST CHAMBER OF COMMERCE.

At the last meeting of the British Columbia Timber and Forestry Chamber of Commerce held on December 30th. at Vancouver, it was unanimously decided to assess each member one dollar for every timber claim held by him, fifty cents to be called for at once. This money is to provide for the current running expenses of the Chamber.

TENDERS FOR

Pulpwood Concessions

TENDERS WILL BE RECEIVED BY THE undersigned up to and including the 16th of December next for the right to cut pulpwood on certain areas tributary to the Nepigon River, in the District of Thunder Bay and Rainy Lake, in the District of Rainy River, and make the same into paper. Tenders should state the amount they are prepared to pay as bonus in addition to such dues as may from time to time be fixed for the right to operate a paper making industry on the areas referred to. Separate tenders must be made for each area or territory, and the successful tenderers will be required to erect a mill or mills on each of the territories or in such other localities as may be approved by the Government of Ontario.

Parties tendering for the pulpwood rights shall accompany their tenders with a marked cheque for 25% of the amount tendered, payable to the Treasurer of Ontario, and to be forfeited in the event of their failing to enter into agreements to carry out conditions, etc.

With respect to the Rainy Lake Pulp Concession, tenderers will be required to make a tender for the right to cut the pine, tamarac and cedar on the territory offered. Parties making tenders for these timbers to state the amount they are prepared to pay per thousand feet B.M. as bonus in addition to Crown dues of \$200 per thousand feet B.M. A marked cheque for \$5,000 payable to the Treasurer of Ontario, must accompany the tender for pine timber and to be forfeited in the event of their failing to enter into agreements to carry out conditions, etc.

No timber shall be cut on either of the Concessions of a less diameter than 9 inches, 2 feet from the ground.

The successful tenderers to enter into agreements with the Government for the erection of the mills, expenditure of money, etc.

For full particulars as to the conditions, etc., application should be made to the undersigned.

HON. F. COCHRANE,

Minister of Lands,

Toronto, Oct. 16th, 1907.

Forest and Mines.

Any length to 40 ft. cut to
order on short notice.

THE TORONTO JUNCTION LUMBER CO.
TORONTO JUNCTION. Limited

VALUE OF SPRUCE EXPORTS.

The export of lumber from St.
John to the United States ports
last year was valued at \$799,300, a
decrease of \$171,566 compared
with that of 1906.

Current Trade Conditions

ONTARIO.

The first half of January, 1908, has developed some encouraging features in the lumbering industry of the province. Not only have inquiries been coming in in encouraging volume, but orders, many of them for immediate delivery, are gratifying the hearts of salesmen. It is the general consensus of opinion that before many weeks are past there will be quite a satisfactory volume of business doing. Throughout the country the majority of the yards have allowed stocks to dwindle down to unprecedentedly small limits. Before stocking up again they intend to wait for some indication as to the probable magnitude of next year's building operations, and in the meantime, carry only what is absolutely necessary. The various municipalities throughout the province are also in the first throes of preparing programs for the year's undertakings, and these, in many cases, afford a standard for the building activity of the community.

Thus far but little interest has been taken in the cut of lumber for the season. At this time last year buyers were eagerly seeking stocks and sales in many cases had long ere this been concluded. Not so for the cut of 1908. Neither operators nor buyers have as yet shown any disposition to get together.

List prices continue remarkably uniform, and no disposition is evidenced on the part of dealers to depart from rates that have all along prevailed.

EASTERN CANADA.

The exports of spruce deals from St. John markets in 1907 were nearly 20,000,000 feet greater than in 1906, and over 48,000 feet in excess of the exports in 1905. This probably accounts partially for the weakness of the British lumber market, which is still strongly enough in evidence. The comparative figures for the three years are as follows: 1907, 203,804,181 superficial feet; 1906, 183,821,251 superficial feet; 1905, 156,765,465 superficial feet.

In addition to spruce lumber, there was exported in 1907, 6,287,842 feet of birch plank and 2,820 tons of birch timber. The export of birch plank was over a million feet less than in 1906, or in 1905, while the quantity of birch timber was little more than half that of 1906 and less than one-third that of 1905.

The sawmills of St. John are with one exception, it is said, all idle. There is a considerable quantity of lumber stored at that point, but considerable quantities are being shipped by the winter steamships to British ports, over 8,000,000 feet having already gone forward. A sufficient quantity of logs to keep the mills busy next summer, even though the winter's cut of logs will be unusually small.

WESTERN CANADA.

An extremely favorable winter has thus far been enjoyed by the logging camps throughout the West. While sufficient snow for all purposes has fallen, the weather has been neither severe nor stormy. The demand for lumber, however, continues extremely limited, but the denuded condition of many of the lumber yards, considered together with this winter's meagre cut, leaves little ground for apprehension as to the ultimate future of the industry. It is generally anticipated that, while a steady volume of trade may be anticipated in the near future, the demand will not be of the reckless nature so characteristic of the demand during 1906.

At present the actual supply of shingles is quite below normal, both in the yards of dealers and manu-

facturers, and a brisk demand for these is anticipated as soon as spring building operations open up.

UNITED STATES.

Already it is said that prices have shown a tendency to advance on a number of items and, although the new lists being sent out by a number of firms show heavy cuts from the prices of this time last year, there is a material improvement over rates which prevailed two months ago. The opening of many factories and foundries at Chicago has also caused considerable activity in the northern pine market during the past week. Prices are said to be low and this has stimulated the sending in of small orders to some extent, although buying from the country yards is still light. A decidedly better feeling is apparent in the yellow pine trade. Prices show an upward tendency.

The hemlock situation is featureless. The demand continues light and material price concessions are being made on all large orders. Country yards are sending in orders only for their immediate requirements, but are willing to make contracts for future delivery at prices now prevailing. No great effort, however, is being made to urge buying. The stocks of eastern spruce in the New York and Boston markets are still large enough to cope with the moderate demand.

With the exception of plain sawn white oak, the trade in hardwoods has shown considerable improvement during the week. A feature of the market in almost all the hardwoods is the placing of orders for delivery at intervals throughout the year. Material concessions are being made on desirable orders for birch and, as many of the yards are holding unusually large stocks, it is possible to buy advantageously.

No revival can be expected in the shingle trade till the return of the building activity. Most of the red cedar shingles now coming in are being placed in storage. Seattle reports state that prices at the mill are slightly better of late. A fair share of new orders are coming in, while stocks at the mills are unprecedentedly low.

GREAT BRITAIN.

Canadian pine timber, which some years ago was the prominent feature in the Liverpool timber trade, is now but a minor subject, and little finds its way into the Lancashire markets excepting what is contracted for long before shipment. Compensation, however, is made for this in the great strides the pine deal and board industry has made in recent years. There has during the past season been little or no variation in price. High class goods sell slowly on account of the extreme prices required, and buyers are naturally driven on to lower grades or other woods as substitutes.

Importers of spruce at west coast ports report that there is very little material arriving per liners, and comparatively little available. Prices show an upward tendency, and the position of spruce from a stock holder's point of view is very satisfactory. "Already," says The Timber Trades Journal, "we are running short of 2 1-2 x 7, although these have been scarce all the season, especially in wagon lengths; and in 3 x 7 or 8 anything longer than 18 feet is valuable; 16 and 18 feet, 3 x 9 and 3 x 11, 14 feet and upwards, should be carefully handled. As regards the scantlings, the only sizes which appear to be scarce, or comparatively so, are 2 1-5 x 5 and 6, and these are in fair demand. 3 x 2 always sell well, and the shipper sends very few. Spruce imported boards are exceptionally scarce; in fact, stocks have not been so low for years as they are at present, and lucky holders should realize this. Deal ends have also met with a remarkable demand this season, and stocks are almost void.

"The demand for birch planks appears to be decidedly better, and holders should be able to obtain a good return on these. 2 1-2 inch and 3 1-2 inch are very scarce this year, stocks being entirely without these two sizes.

"There are good stocks of hemlock deals, and prices are fairly firm, although the outlook is not so bright as it is with spruce, as stocks are, perhaps, a shade heavier than the demand warrants.

"Quebec pine still maintains its

firmness, and prices will advance further yet before next season."

BOUGHT TIMBER LIMIT.

The Dominion Iron & Steel Company, of Halifax, N.S., is reported to have purchased some three hundred acres of valuable timber at East Bay, and should the report of the men who will cruise the property prove satisfactory mills will be installed on the property. Otherwise the output will be rafted to Sydney. The major portion will be used at the company's mammoth works at Marble Mountain, where it is expected a number of shacks will be constructed in the early spring. It will also be used for pit purposes, sleepers, etc., both at the quarries and at the big steel plant.

ST. JOHN SPRUCE EXPORTS.

The export of spruce lumber from St. John, N.B., to trans-Atlantic ports last year showed an increase of twenty million feet over that of 1906, and more than forty-eight million feet over that of 1905. 204,000,000 feet. With regard to birch, only a little more than six million feet were exported last year, as compared with over seven and a half millions in 1906 and seven and a quarter millions in 1905.

CUT OF B.C. TIMBER IN 1906.

Statistics show that the cut of the British Columbia mills during 1906 was as follows:

	Feet.
Coast mills	450,000,000
Mountain and interior mills	340,000,000
Total cut, 1906	790,000,000
Foreign shipments from coast mills	85,250,000
Car shipments	215,075,000
Local trade (estimated)	60,000,000
Shipment of mountain mills (estimated)	240,000,000
Total	600,325,000

Total stock carried over into 1907 189,675,000

THE NEWS

The Rathbun Company's sash and door factory at Deseronto, Ont., which closed down for repairs just before Christmas, was re-opened on the 6th inst.

W. J. Malcolm of Hazelmere, B.C., has placed an order with the Schaafe Machine Works of New Westminster for a complete circular saw mill outfit, capacity 20,000 feet per day.

The Miramichi Lumber & International Paper Company are negotiating for the purchase of D. & J. Ritchie's lumber property at Newcastle, N.B. The transaction will involve about a quarter of a million dollars.

The latest arrival of the Blue Funnel ships brought a large shipment of special steel for the A. J. Burton Saw Works, Vancouver, from the Jessop Steel Company, of Sheffield, Eng. This steel is to be used in the manufacture of band, gang and drag saws.

A terrible accident occurred last week at Salmon's planing mill, New Liskeard. Frank Lenox, an employe of about forty-six years of age, was engaged in sawing when his glove caught, pulling him forward on to the saw, which literally cut him to pieces.

Representative lumber dealers of Florenceville, N.B., and district, met together a short time ago for the purpose of discussing the erection of a new flooring mill. The project was unanimously endorsed and it was decided to proceed forthwith with the organization of a company.

The St. Lawrence Lumber & Mining Company, Limited, capitalized at \$50,000, have been incorporated with head office at Cornwall, Ont. Amongst the incorporators are W. R. Hitchcock, Cornwall, Ont., H. B. Chase, L. A. Chittenden, H. A. Reed and G. W. Minkler, all of Massena, N.Y.

From the Murray Iron Works, Burlington, Ia., we have received an interesting booklet, fully illustrated, setting forth in detail their

"Standard Murray Corliss Engine." The engine is elaborately explained in 22 pages of detailed drawings, every part of the mechanism being fully treated.

Cecil W. Stancliffe & Company have established an office in Vancouver, corner Water and Cordova streets, where they are carrying on business as machinery and mill supply agents. Mr. Stancliffe is an engineer by profession, having had a wide experience in the old country before coming to Vancouver.

D. MacLean, clerk to the Lydon Lumber Company, in the Porcupine Hills, Alta., had a close call from death by exposure early in the month. Missing the track, he wandered about the hills for six hours before he discovered the place at which he was living, and when discovered was in the last stage of exhaustion, with both hands and feet frozen.

Considerable indignation has been expressed by the trade in the Rainy River district at the action of the Grand Trunk Pacific in purchasing large quantities of timber for western construction in Minnesota. They claim that all the material so purchased could have been supplied by them instead of allowing nearly a quarter of a million to find its way into American pockets.

The A. J. Burton Saw Company, Limited, of Vancouver, have just received a carload of machinery, thus completing their new equipment for making band saws. The machinery includes one of the latest tempering furnaces, automatic tooth machine, hydraulic flattener, polishers, etc. They have completed a 160 foot extension on to the rear of their premises, wherein this new machinery will be set up.

C. R. Betts and C. T. Mescher, well-known millmen of Puget Sound, B.C., have acquired about three miles of timber limits on Salt Spring Island, and will shortly commence the erection of a saw mill, which is to have a capacity of about twenty-five thousand feet per day. The property is covered with timber most suitable for ties and piles, and special attention will be given to the manufacture of these articles.

WINNIPEG — MAN.

opened up offices in Vancouver at 14 McKinnon Building, where they have installed complete modern appliances for blue printing and drafting work of every description for timbermen and surveyors. An important feature of their work is their timber maps of British Columbia, which are corrected every fortnight. The manager of this company is Mr. E. Plowden, formerly of the Winnipeg city survey.

It is reported that Lord Northcliffe, better known as Alfred Harmsworth, the great English publisher, is practically cornering the world's pulpwood supply by investing no less than \$4,000,000 in the Newfoundland industry. Experts on the other side are of the opinion that the newspaper man is making a great financial coup. The supply of material in Newfoundland is practically unlimited, but the promoters of the scheme will take no chances and will guard against exhaustion by systematic tree planting.

A startling occurrence and miraculous escape are reported from Wallace, Idaho. While the Barnard family, who live at the base of the mountain, were sitting in their kitchen, a large fir log, seventy-five feet long and eighteen inches in diameter, which had become detached half a mile further up the mountain, struck the end of the house and demolished the range in the room where the family were seated. The timber passed right out of the dwelling and no damage was done other than that to the building.

There have been many inquiries concerning the big plant at Sturgeon Falls, Ont., of the insolvent companies, the Imperial Paper Mills and the Northern Sulphite Mills. The pulp mill at this point has been valued at \$5,000,000 and is considered one of the best on the continent. The Ontario Government have made valuable concessions from time to time, and an almost inexhaustible supply of pulpwood is ensured. We hear from the receiver, Mr. E. R. C. Clarkson, that a number of American publishers have been getting together with a view to the purchase of the property.

One hundred and eighty loggers and seamen of Vancouver, B.C., were given the time of their lives at the city hall on New Year's Eve, when they were entertained to a dinner and concert by the Ladies'

Guild connected with the British and Foreign Sailors' Society. The hardy lives of those present had developed in them particularly good appetites, and they rose to the occasion in creditable style to dispose of the many delicacies and good things supplied by the different city churches. Mr. G. F. Gibson, chairman, in according those present a warm welcome, gave a brief outline of what the committee were undertaking for the men of the forest and the sea. He hoped that in a very short time the committee would be in a position to open suitable premises as an institute and home. Captain C. Eddie also spoke a few words of welcome. There were several well-known citizens present, including Messrs. Peters, Dalton, Crisdale, E. W. Leeson and Rev. R. J. Wilson.

HOLDING HEAT WITH SAWDUST.

A. K. Campbell, a builder of Indianapolis, believes that if the American people could be brought to see the value of sawdust as a packing for walls and ceilings they would be able to keep their houses warmer in winter and cooler in summer.

Mr. Campbell's idea is that the sawdust shall be used as an insulator, filled into the crevices of the walls and the ceilings while the building operation is in progress. This, he argues, would prevent the heat from escaping during the winter, and would, of course, retard the entrance of heat in the summer. Recognizing that sawdust does not meet with popular favor because it is generally believed to be damp, combustible spontaneously and likely to decay, to emit odors, and to serve as a nesting place for rats, he replies that thirty-seven years' experience has shown him that none of these objections are tenable.

In discussing the subject for the Indianapolis "Star," Mr. Campbell had this to say about these objections:

"Sawdust does not decay where there is no moisture, and as it is a slow combustible it is an actual protection against fire. Rats cannot live in walls when they are tightly stuffed, and any slight odor from the wood is dispelled in a few weeks. And, furthermore, I want to point out and light running. There was not even a double sur-take more pains to out that it costs only a few dollars to fill the walls of an entire house."

Needs No Paint

EVERYBODY likes the "no paint" idea of Amatite. Its mineral surface is better than paint. It doesn't wear out. It doesn't need renewing. Just leave it alone and it will give perfect service for years.

Selecting Amatite is simply a matter of common sense. The man who looks ahead and calculates the extra bother and expense he will have after he buys a painted roofing will always buy Amatite.

The large and careful buyers such as big dairy companies and railroads, have found Amatite greatly superior to the "skin-coated" ready roofings. (The above view shows a railroad building—the depot at Orange, Texas, on the O. & N. R. R.—roofed with Amatite.) Saving the painting makes Amatite by far the cheapest roof made.

Investigate Amatite—this mineral roofing that needs no paint.

We will send on request a little booklet about Amatite and a free sample. Write to our nearest office.

1908?

YES, we are optimists and have the utmost confidence in 1908. We have increased our facilities for supplying "QUALITY" SPRUCE of superior grade and the finest possible mill work. We are now in position to take care of either straight car business for FLOORING, CEILING, PARTITION, NOVELTY SIDING, NEW BRUNSWICK CEDAR SHINGLES, LATH, etc., or thoroughly mixed cars of the above. Our facilities for this business are unequaled anywhere. If you wish small quantities of various varieties we can serve you as well as on straight car shipments.

We have built up our trade to its present large volume through uniformly fair treatment of customers and close attention to the quality of our products. We believe that "Quality is the best policy." Our customers believe it also. It means to them satisfied trade, larger profits, increased business, and the satisfaction of always handling the best of its kind. The time when any old thing would do has passed. Now people want things right. They feel with us that "Quality is the best policy." If you do not know the meaning of "FENDERSON QUALITY" you will do yourself a favor by trying "Quality Policy" and Stock.

RESAWING MACHINE

As can be seen by the engraving, the frame is cast in one piece. The legs of cast iron are cast in one piece with the saw bench. This makes an extremely substantial machine.

The feed rolls 12" diameter are driven by cut gears 16" in diameter. The proportions of the gears are such as to give a powerful driving mechanism.

The arrangement to set the stationary roll (not shown in the cut) is very accurate, quick and reliable. The clear distance between the slides is 19."

The steam press is of improved construction and has a travel of 10"

The saw is 42" and saw arbor bearing is set in slide so that saw can be brought closer to the rolls, as it wears.

The weight of the machine is 3,000 lbs.

Iron Frame "Simplex" Shingle Machine

IN this, our latest design of Shingle Machine, we have incorporated all the advantages contained in our wood frame "Simplex" and added several improvements.

The arbor has been made heavier and a third bearing added to support it outside the driving pulley. The method of putting lead in the saw arbor has been greatly improved. This is now done by swinging on a centre directly under the saw the whole frame which carries the arbor. Thus the alignment of the bearings is not in any way affected and there will be no danger of hot bearings after the lead has been changed. The change may be made while the machine is running and without stopping the carriage.

An improvement has also been made in the method of driving the edger. It is belted direct from a shaft running at right angles to the main arbor from which it is driven by means of a bevel friction. This makes a very neat compact drive and has proved satisfactory in the mill.

The rail on which the carriage travels is made of square steel and when worn can be renewed by simply turning upside down.

Over three hundred of our Upright Machines (wood and iron frames) are in use in British Columbia and Washington.

BE METHODICAL! USE **THE SHIMER CUTTER HEAD**

And enjoy **SYSEM** for Tonguing and Grooving Lumber.
\$23.80 the set for Figs. 1 and 2, up to \$50.00 the set for the best Intermediate Cutter Head we pull out.

It's a Head that holds a claim over you for strength because it's forged of test steel bars and billets having a strength of over 60,000 pounds to the square inch.

It's a Head in which the bit seats retain accurate position for positive and unqualified results.

The bits carry the exact outline of the pattern to be made, in counterpart, and cut with a perfect side clearance every kind of hard, cross-grained and knotty lumber.

They impart to the working system of any mill the finest method of interchangeable cutter heads, because every matcher, jointer or ship-lap head made for the machine will apply to it interchangeably and without alteration to guides.

YES, THE SHIMER CUTTER HEAD is a **BUILDER** of **SYSTEM** the **MILL**, and for that reason you need it and should buy it.

STEEL GEARING

FITTED IF DESIRED.

THE MARKET IS DEMANDING more and more Lumber of Standard Lengths and with Square Ends

Lumber of this kind LOOKS BETTER, FINDS A READIER MARKET and COMMANDS
A BETTER PRICE than lumber of random lengths and with irregular ends.
In fact, no mill can truthfully be said to be up-to-date that has no trimmer.

THE TOWER ONE-MAN 2-SAW TRIMMER

will do MORE WORK in a given time than any other machine in the same class on the market, and that with LESS FATIGUE to the operator.

Why is this?

It is because with other trimmers, every time the saws are to be set to cut a different length the operator has to go clear to the end of the MACHINE.

With the TOWER One-man 2-saw Trimmer, he goes

Only to the End of the BOARD.

To see what this means, let us take a little illustration.

The No. 24 trimmer trims from 6 to 24 ft., both lengths inclusive, and the machine is 26 ft. 6 inch. long over all.

We will take an extreme case, and suppose the operator has just trimmed a 6 foot board and is about to trim an 8 foot one.

With an ordinary trimmer he would have to walk from the end of the 6 foot board to the end of the machine and back to the end of the 8 foot board—a distance of 19 ft. 6 inch.

With our trimmer he would simply move 1 ft. 0 inch., turning the crank one complete revolution as he did so. This would bring the saws 2 feet further apart, each saw moving one foot, in opposite direction.

Thus our trimmer SAVES STEPS. This implies LESS FATIGUE to the operator and MORE WORK, because there is LESS LOST TIME.

MADE IN TEN DIFFERENT SIZES.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other
foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOOD-WORKER is published in the interest of and reaches regularly persons engaged in the lumber, wood-working and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN AND WOOD-WORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — FEBRUARY 1, 1908 — MONTREAL

CUTTING OF RAILROAD TIES.

The recent awarding by the Grand Trunk Pacific of a contract for 125,000 ties to lumbermen in northern Minnesota, has drawn some strong adverse comment from lumbermen who rightly maintain that all such supplies should be obtained in Canada. It has since been made public that the contract in question is but a small one, and will lay only about 40 miles of track, whereas almost a thousand miles are graded. The Grand Trunk Pacific, it is said, gave contracts in Canada three years ago for three million ties, and has since awarded contracts for two million more. All of these, it is stated, should have been already delivered, but out of the five million less than half a million have been delivered thus far. The company claim to have grading done, bridges in place, steel available and plenty of labor at call, but is unable to get rails down owing to lack of ties.

Tie cutting in Canada has not yet become systematized. In districts where this is an occupation of considerable proportions there is a woeful ignorance or neglect of the most elementary principles of lumbering economy, so that not only is the rate of output slow, but the amount of waste unreasonably large. The heavy drain now made upon our forests by the different industries of the region could be much reduced without diminishing the supply by adopting more economical methods in the utilization of the individual trees. The chief use of second growth nowadays is for cross ties and mine timbers and economy in management must be brought about chiefly with these products. Of the two, ties are the most important.

White oak, which formerly made up a large part of the tie timber used by railroads, has now become so scarce that it is being replaced to an ever-increasing extent by the cheaper and more abundant woods. The kinds chiefly cut in Canada are cedar, hemlock and tamarac. The specifications of the railroads demand pole ties—that is, the ties are cut from trees large enough to permit of one tie only being made from a section. Hence heartwood is exposed in the faces of the ties, while the rounded sides have a layer of sapwood. The ties are 8 feet long, with sawed ends. The depth between the faces must be uniformly 6 or 7 inches, and each face must be at least 6 or 7 inches wide at the narrowest point. Cutting and hewing generally begin in September and continue till the end of March. The hauling season opens about the first of February and closes about the beginning of April. The ties are then

corded along the right of way to await shipment to their destination.

In a circular just issued by the Forest Service of the United States Department of Agriculture, some interesting statistics are given of the saving that might be effected by economical cutting. Tables 1 and 2 give a clear idea of the wastefulness of the present methods of tie production. Out of every 100 trees cut for ties over 63 are taken to a top diameter of from 10 to 13 inches instead of 9 or 9 1-2 inches, the smallest diameter from which a 6 by 8-inch tie can be made. Out of 100 trees of 14 inches and over, whose butt logs could be split, two-thirds remain entirely unsplit, and of the remainder only a small number are split into the number of ties justified by the size of the logs.

Table 1 brings out strikingly the wastefulness of the present manner of tie cutting. In a certain case where ties were being cut, 100 trees, embracing all diameters from 10 to 19 inches, were measured, the actual number of ties yielded by each ascertained, and the total cubic contents of each of the trees, as well as the contents of the portion used for ties, computed.

Diameter of trees breast-high.	Volume of usable length of tree.	Volume of used length of tree.	Ties produced.	Waste of used length of tree.	Waste of usable length of tree.	Wood used for one tie based on used length of tree.	Wood used for one tie based on usable length of tree.
Inches.	Cubic feet.	Cubic feet.	Number.	Cubic feet.	Per cent.	Cu. feet.	Cubic feet.
10	14.3	6.1	1.3	2.6	43	10.8	4.7

19	78.5	51.3	5.2	37.4	73	62.6	9.9

TABLE NO. 1.—WASTE IN PRODUCING SLAB CROSS TIES, ASSUMING EACH TIE TO CONTAIN 2.67 CUBIC FEET.

Thus from 43 to 73 per cent. of the logs used for ties and from 75 to 82 per cent. of the whole tree are entirely wasted. This waste is enormous if we consider how much wood must be consumed to produce the 20,102,000 ties which are each year cut in that particular region. It amounts to about 221,122,000 cubic feet of wood, on the basis of the entire merchantable contents of the tree, or 140,714,000 cubic feet of logs, on the basis of the part actually cut. Of the total amount of timber cut for ties, nearly three-fourths is wasted. That this waste can be much reduced is proved by tie cutting in Germany. There also the majority of ties are hewed, while the common tie is larger than our standard tie. It is 8.17 feet (2.5 meters) long, has 10.2 inches (26 cm.) face, is 6.29 inches (16 cm.) thick, and contains 3.5 cubic feet instead of our 2.67 cubic feet. Yet in Germany it takes only from 4.4 to 5 cubic feet of log to produce one tie, while in this country it takes on an average from 7.5 to 8 cubic feet of log to produce a smaller tie. In spite of very strict specifications, the waste of timber in hewing does not there exceed 30 or 40 per cent. of the log, while in this country it reaches 73 per cent., to say nothing of the top, which remains entirely unused.

The waste in hewing oak ties is greater than in hewing pine ties, since it takes about 11 cubic feet of hardwood timber to produce one tie and only 9 cubic feet of pine wood. This is due, not to any greater waste necessarily involved in hewing hardwood ties, but to the smaller taper and proportionately longer clear length of the pine as compared with oak.

With no inspection of the sizes and characters of the trees cut, the tie makers are guided in their choice of tie timber and the portion of each tree to be used for ties merely by their own convenience and by the ease with which the trees may be hewed into ties. By taking each tree to a top diameter of 9 inches outside the bark, cutting stumps not higher than 2 feet from the ground and splitting into ties all logs large enough, an increase of from 67 to 185 per cent. can be effected in the yield of individual trees above 15 inches in diameter. This is shown in Table 2, which compares the average number of black oak ties obtainable under the present practice and the number possible under more economical methods of tie cutting. The possible yield of ties per tree is based on the taper measurement of black oak.

Under more rigid supervision the present yield in ties per acre could, in a great many cases, be doubled and even trebled, if all trees large enough were made into ties. At present many trees are left uncut, not out of consideration for the future of the forest, but because they are too large, tough, or crooked to be easily hewed into ties, while the

straightest and youngest trees are taken because they yield the greatest number of ties with the least effort. Table 3 gives the actual yield of 15 sample acres and an estimate of what could be obtained from them if all the trees of tie size were made into ties under more economical methods.

Diameter breast-high.	Ties cut.		Increase.
	Under present practice.	Under more economical methods.	
Inches.	Number.	Number.	Per cent.
12	2.7	3.0	11
13	3.0	3.6	20
14	3.3	4.3	30
15	3.6	5.9	64
16	3.9	6.5	67
17	4.2	8.0	90
18	4.5	11.1	147
19	4.9	13.5	176
20	5.4	15.4	185

TABLE NO. 2.—COMPARISON OF THE AVERAGE NUMBER OF BLACK OAK TIES PER TREE OBTAINED UNDER PRESENT PRACTICE, WITH THE NUMBER POSSIBLE UNDER MORE ECONOMICAL METHODS OF CUTTING (TIES UNDER 12 INCH CANNOT BE USED ECONOMICALLY FOR TIES.

By taking all trees that can be made into ties, even as cutting is now practised, the yield per acre would be increased by from 60 to 125 ties, and with the closest utilization of each tree an increase of 170 ties might be secured from each acre. In this way, to supply the required number of ties, the forest area now annually cut over for ties could be reduced nearly two-thirds and the revenue per acre increased.

Age of stand.	Type.	Actual yield of ties.	Yield by taking all trees of tie size by the present methods.	Possible yield of ties by taking and fully utilizing all trees of tie size.

TABLE NO. 3.—COMPARATIVE YIELD OF TIES PER ACRE UNDER PRESENT SYSTEM AND UNDER MORE ECONOMICAL METHODS.

The greatest economy would be effected in the utilization of tie timber if all trees above 13 or 14 inches in diameter were sawed instead of hewed into ties. Where sawed ties are as readily accepted as hewed ones, and where logging is not difficult, sawing will usually prove cheaper and more profitable than hewing.

During the next few years the tie cutting industry in Canada is bound to assume unusual proportions, owing to the activity that will prevail in track laying, particularly in Western Canada. Even now in many Western districts, tie cutting is the only healthy branch of the lumbering industry and will continue to be such for some time to come, while in Eastern Canada it is scarcely less important.

ANNUAL MEETING, MOUNTAIN LUMBER MANUFACTURERS' ASSOCIATION.

The annual meeting of the Mountain Lumber Manufacturers' Association was held in the Association's rooms, Nelson, B.C., on Friday and Saturday, January 10 and 11 last, with President Lund occupying the chair. Practically every mill in the mountains was represented. The president gave a short address referring to the depressed condition of business, and expressing the hope that the manufacturers would prove themselves possessed of the courage and determination to meet and successfully cope with the present unfavorable situation.

The Secretary, Mr. W. A. Anstie, then presented his annual report, reviewing the work of the Association for the past year. It developed that, despite the decreased demand, very satisfactory prices have been obtained for all sales up to date, and there is no disposition on the part of the mountain lumbermen to sacrifice their stock, as it is realized that lumber now in pile was produced at a maximum of cost and the mills must obtain list prices if they are to make a profit.

At the beginning of 1907 it was estimated, from the announcements

of the different operators, that the aggregate production for the past year would be at least four hundred and seventy-five million feet, but, owing to the large curtailments which were adopted on every hand when the market became so poor, only a total of three hundred million feet was produced in the entire Mountain district. As the mountain mills commenced last season with eighty-eight million feet of lumber in pile, and to-day have one hundred and eighty million on hand, this would show that their total sales for the year 1907, amounted to approximately two hundred and eight millions.

From the declared intentions of most of the manufacturers it is safe to state that very few of the mountain mills will resume cutting operations, for this year, before the middle of April or the first of May, as it seems to be generally felt that their present stock is sufficient for the supplying of all demands upon it for some time to come.

A short report was brought in by the secretary, referring to the trial of Mr. W. H. Clark, of Edmonton, president of the Alberta Retail Lumber Dealers Association, who was charged with conspiracy in the restraint of trade. It was shown that despite the strenuous efforts of the Alberta Deputy Attorney-General to establish the fact that there existed some illegal relations between the Mountain Association and the Alberta Association, Chief Justice Sifton, in his judgment held that there was no evidence to show that any such relations existed, and that Mr. Clark was not guilty of the charge referring to the Mountain Lumber Manufacturers' Association. It will be remembered that the Alberta authorities tried to prove that the Mountain millmen discriminated in favor of dealers who were members of the Alberta Retail Association as against dealers who were not members, whereas the facts did not bear out any such allegation. Financial responsibility is the only point upon which the manufacturers desire to be satisfied, when they make shipments to the dealers.

Considerable time was taken up at the convention with the routine business of the Association, having regard to its finances, sales, and insurance departments. The officers elected for the ensuing year were: President, P. Lund, Wardner (re-elected); vice-President, Otto Lachmund, Arrowhead and Secretary-Treasurer, W. A. Anstie, Nelson (re-elected).

Dr. Judson F. Clark, and Mr. T. F. Paterson, of the British Columbia Timber and Forestry Chamber of Commerce gave an interesting address regarding the aims and objects of that organization, as also did Messrs. Emmerson, Roe, Tucker, Agar and McRae, of Vancouver. Later, a resolution was adopted by the Manufacturers' Association, expressing its approval and sympathy with the purposes of the Chamber, and a committee was appointed to confer with the representatives of the Chamber, regarding representations to be made to the Government regarding proposed legislation affecting timber lands.

The price list was given some consideration, and a few reductions were made on some of the higher grades of lumber, but common lumber remains the same. The changes made were in the nature of necessary revisions, as several inconsistencies existed in the last list.

The social side of the convention was attended to on the evening of Friday, Jan. 10, when the officers and members of the Association entertained their visitors and the prominent business and professional people of the district at a ball. This was a most enjoyable and successful event.

PREFER CANADIAN PULP.

According to an English authority French paper makers prefer Canadian wood pulp on the ground that the Canadian pulp gives a better surface. For long years the French custom house has insisted that the pulp boards should be perforated, to prevent them from being used as cardboard, upon which there is a higher duty. Makers of pulp in the Dominion have demurred against the perforation rule, as it increases the cost of production; hence the French market is partially closed to them.

B.C. LUMBER PRICES FALL.

At a meeting of the British Columbia Lumber Manufacturers, held in Vancouver on January 23, it was decided to reduce prices to the extent of \$2.50 off lower grades and \$2 off some of the upper grades. Financial depression is the reason assigned.

THE PULPWOOD INDUSTRY IN NOVA SCOTIA.

"The pulpwood industry in Nova Scotia has been a very unsatisfactory line of business," writes Mr. Frank Davison, president of the LaHave Pulp Company, Limited, in a recent communication to THE LUMBERMAN. "As lumbermen we invested twenty years ago in a pulp-mill and have kept in touch with the business ever since. All the mechanical mills built in Nova Scotia have lost all the capital invested in them and the present owner, who obtained them for one-quarter their value lost money every year they ran them until the late advance of July, 1907. The cutting of pulpwood destroyed all hope of acquiring a

GROUND WOOD PULP MILL AT NEW GERMANY, N.S.
(Property of LaHave Pulp Company, Bridgewater, N.S.)

larger and more valuable growth, which can be obtained from the same timber in fifteen years' time.

"The rivers in Nova Scotia are too small, and isolated to attract a full plant of the sulphite and paper mills so the full benefit cannot be derived from the small timber. Larger timber, being on the Atlantic seaboard, commands the full market price of the world's best markets and can be manufactured by cheap, small mills at every port along the coast of the Province, while pulpwood is very costly to transport very far from its place of growth.

"The three ground wood pulp mills on the south shore of the Province are only 25 miles apart, and can secure all the pulpwood of that district and pay a higher price than can be procured by shipping to any American mills. Contracts have been made with English buyers for wood pulp made in 1908, at paying prices and it is now hoped that mill owners can secure a profit from the business, which has never yielded any dividends to investors in the past.

"Liverpool, Medway, or Bridgewater might attract capitalists to invest in other branches of the paper business, as the production of the four wood pulp mills, about 12,000 dry tons, could be connected very easily by the Halifax & South Western Railway, and an assured supply of spruce pulp could be provided better than at any other part of Nova Scotia.

"However, the culture of the forest and its preservation from fires is now receiving more attention from the land owners of this part of the country, and they realize that a handsome return is assured them whether the product is manufactured into lumber, pulp, or paper. It is to be hoped that all efforts made to preserve our forest wealth may receive the support of all our legislators, and capitalists, since nothing can contribute more to the general welfare of the country."

OPTIMISTIC OUTLOOK FOR ONTARIO.

Mr. Hugh Davidson, manager of the Hastings Shingle Manufacturing Company, Limited, of Vancouver, spent the holiday season in Ontario. Seen by a representative of the LUMBERMAN Mr. Davidson expressed a belief that trade would revive in the near future. While he scarcely hoped for the active demand of a year ago, he was convinced that a good summer's business was in prospect. In the meantime extreme caution was the order of the day.

A. KNECHTEL, INSPECTOR OF FOREST RESERVES.

The staff of the Forestry Branch of the Interior Department has been greatly strengthened by the appointment to the position of Inspector of Forest Reserves of Mr. A. Knechtel, lately the forester employed by the New York Forest, Fish and Game Commission. This is but one step in the direction of enlarging and strengthening the staff of the Forestry Branch, which is being done as rapidly as trained men become available. It is also a good example of the fact that the tide is turning in the direction of Canada, and that Canadians who have gone over to the United States are finding that Canada is now offering greater opportunities.

Mr. Knechtel was born in Brussels, Huron County, Ontario, where his father owned a farm of 200 acres, heavily timbered, and in helping to clear which he spent three winters in the woods. The experiences he had there, and the knowledge obtained of the woods, have been of very great benefit to him in forestry work. On leaving the farm at the age of sixteen he spent two years at wood turning and two at carpentry. He then turned his attention to educational pursuits. After spending a year at school in his native village he obtained a teacher's certificate, attended the Model School at Clinton, taught two years in Huron County, spent three months as a student in the Collegiate Institute at St. Catharines, and three months at Business College in London, Ontario. He then went to Michigan, took the four years' agricultural course in the Michigan Agricultural College, and graduated with the degree of Bachelor of Science.

While taking senior work there Mr. Knechtel taught in the college two classes in algebra and one in geometry, afterwards teaching botany.

A. KNECHTEL, INSPECTOR OF FOREST RESERVES, OTTAWA.

mathematics, physics, German and Latin in the high schools of Detroit, St. Charles, Chesaning and Leslie, Mich. His forestry course was taken at Cornell University where he received the degree of Forest Engineer from the New York State College of Forestry. While teaching school and attending college he spent his vacations looking after the work in a sawmill in Muskoka, which he owned from 1893 to 1903.

After completing his course in forestry, Mr. Knechtel was first employed by the United States Bureau of Forestry in making a study of the natural regeneration of the commercial trees of the Adirondacks. From August, 1901, till January 1, 1908, when he went into the employ of the Dominion Government, he was chief forester for the Forest, Fish and Game Commission for New York State, under direction of which he made a classification of the forest lands of the State, established forest

nurseries, superintended the planting of 2,500,000 trees in the Adirondacks, organized the work of collecting tree seeds, and took charge of the fire protective service.

In 1903 he made a collection of all the commercial woods and wood products of New York for the Louisiana Purchase Exposition, held at St. Louis, Mo. In the spring of the next year he went to St. Louis and made on the Exposition grounds a forest nursery of 100,000 living trees for which he received a silver medal and the Forest, Fish and Game Commission a gold medal from the Committee on Awards.

In 1904 Mr. Knechtel was sent by the State to Europe to study and photograph the forests. He spent four months in visiting France, Germany, Austria, Switzerland and Italy, bringing back with him 300 negatives showing phases of forestry work abroad. He has published a number of bulletins and articles on forestry subjects, some of the more important being: "The Cultivated Forests of Europe," "Methods of Estimating and Measuring Standing Timber" and "Making a Woodlot from Seed."

During the winters of 1906 and 1907 he lectured on forestry subjects in fifty places in cities and villages of the State. He has now ten appointments for the month of February in New York City where he lectures for the Education Department. In these lectures, which are illustrated, Mr. Knechtel presents one hundred stereoptican views made from his own negatives, taken at home and abroad. There are pictures of forests, lakes, rivers, waterfalls, birds and wild animals in the woods, boating, fishing, hunting, fire fighting, lumbering and forest planting. They are all colored true to life and are very beautiful indeed.

NEW REGULATIONS GOVERNING LOG BOOMS IN HARBORS.

By a recent order-in-Council new regulations, designed to assist harbor masters in controlling the movements of logs in restricted harbors, have gone into force. These are as follows:—

All ships, vessels, rafts, booms or logs, or any other floating property, in any harbor or port, shall take their berth in such part of the harbor as the harbor master or his deputy may direct, and the master or other person in charge shall load or unload his vessel at such part of the harbor and in such manner as the harbor master or his deputy may direct, and the master or other person in charge of any ship, vessel, raft, boom or logs, or other floating property shall cause the same to be removed whenever the harbor master or his deputy shall deem it necessary so to do, to any other station or berth within the harbor, and in the event of no person being found in charge of any ship, vessel, raft, boom of logs, or other floating property, or the person in charge refusing or neglecting to remove the same when directed so to do, then the harbor master or his deputy may remove such ship, vessel, raft, boom of logs, or other floating property, to any station or berth within the harbor as in his opinion shall best promote the interests of those doing business in or about the harbor, and the expense of such removal shall be a lien against the ship, vessel, raft, boom of logs, or other floating property, so removed, and such ship, vessel, raft, boom of logs, or other floating property may be detained by the harbor master or his deputy until all expenses incurred by such removal are paid and fully satisfied, and should it be necessary for vessels or floats to be alongside of or moor or make fast to each other, it shall be lawful for the officers and crew of the outside vessel or float, and others having business with them to work over the deck of the inside vessel or vessels in the loading or unloading thereof, without obstruction or interference from the officers or crew of such inside vessel or vessels, provided the inside vessel or vessels shall not be injured or obstructed thereby.

The harbor master shall have power to order the removal of any scow, boat or other vessel loaded or unloaded, or anything calculated to interfere with the moving or mooring of vessels from any part of the port or harbor to any other part thereof; and the owner of such scow, boat, etc., or person in charge thereof, failing to make such removal in one hour after being notified so to do, shall forfeit and pay a sum not exceeding fifty dollars, and after one hour shall have elapsed the harbor master shall have power to make the removal and charge the person notified for so doing.

To enable the harbor master at Victoria, B.C., to regulate the quantity of logs to be brought into the harbor, as well as to restrict the purpose for which they shall be so brought in, section 41 of the said

rules and regulations as established by Order-in-Council of the 4th April, 1905, be repealed and the following substituted therefor:—

No part of the harbor of Victoria, B.C., situate between the railway bridge and the shore of James Bay shall be deemed to be an anchorage for vessels, and vessels anchoring in this part of the harbor, may do so only as a temporary expedient, and the harbor master is authorized to cause the immediate removal at his discretion, of any vessel so anchoring. This regulation does not apply to such small vessels and yachts as may be permitted to moor in the extreme eastern part of James Bay. The harbor master at Victoria shall have authority to regulate the quantity of logs which any mill owner may bring into the harbor at one time and store in the harbor at one time, and no logs shall be brought into Victoria Harbor that are not intended to be sawn at one of the mills in the harbor. The penalty incurred by the violation of this regulation is a fine of twenty dollars.

SEVENTY-FIFTH ANNIVERSARY.

One of the neatest and most interesting anniversary books yet published has just been issued by the Simonds Manufacturing Company. It records the early beginnings of the company in 1832, and indicates its present magnitude at this, the close of its seventy-fifth year.

The first Simonds shop opened in Fitchburg, Mass., where at present is located the company's executive offices and one of their large factories, the other two being at Chicago, Ill., and Montreal, Que. The book describes the Chicago mill in which Simonds special saw steel is made, and shows half tone prints of all factories. Interior and exterior views are shown of branch offices at New York City, Chicago, New Orleans, San Francisco, Seattle, Portland, Toronto, St. John, Montreal and London,

Eng.; likewise photographs of the clerical forces at the different offices, office managers, salesmen and oldest employees. One page, bearing the slogan "Simonds Saws are the Best," suggests the company's strong advertising campaigns to instil this thought into the public mind.

Throughout the book very little is said about the Simonds products, saws and machine knives. Describing the organization, the factories, offices and people connected with the company, seeming to them sufficient indication that the manufactured article would be one of high quality. The book bears the imprint of the University Press, Cambridge, and is being distributed among firms interested, the lumbering and saw industries.

PULPWOOD CARGO CAUSES WRECK.

The steamship "Campania," on her arrival at Queenstown recently, reported that the barque Germanic, Captain Fleetwood, of Weymouth, N.S., has foundered in mid-Atlantic. Seven of the crew were rescued after suffering for eight days in an open boat. The captain had been killed by a falling spar at the moment when the Germanic sank. The remaining seven of the crew in the second boat are believed to have been lost. The foundering was caused by the cargo of woodpulp, which became flooded during heavy weather and swelled, bursting the decks and opening the seams. The survivors endured terrible hardships.

Practical Forestry on a Spruce Tract*

By AUSTIN CARY

THE TRACT.

The spruce-bearing portion of the Androscoggin Basin, within which the company's tract is situated, includes most of its upper half, extending easterly from the White Mountains across the Rangeley Lake region in Maine, and thence north to the Canada line. Its topography is uneven and sometimes very rough, with numerous mountains, some of which rise to more than 3,000 feet above sea level. The main streams are drivable, but a drawback in logging is the steepness of some of the slopes. Much of the region is too rough for bare-ground logging. Snow comes, as a rule, about the 1st of December, and is 3 or 4 feet deep by the 1st of March.

Red and white spruce are distributed over the region and reach a fine individual development. The higher mountains are covered with almost pure forests of spruce, and the swamps and flats are timbered largely with spruce and fir, while the slopes and ridges bear varying stands of spruce, fir, birches, maples, and beech. Throughout the region there is abundant reproduction. Cut-over mountain sides, if they remain unburned, come up densely to spruce and fir, and elsewhere reproduction as a rule is good.

The lands of the company, then, though varied in character, are valuable chiefly for the spruce timber standing upon them. The company, in 1898, owned about 300,000 acres, and its annual cut—in part, however, from other holdings—was 70,000,000 board feet. Part of this was sawed into lumber and the rest used for paper pulp. From the mills at Berlin Falls, N. H., the highest point on the Androscoggin River reached by railroad, operations of the company were scattered through the woods of the region to the sources of the river, 100 miles away. Driving employed a large force of men in the spring, and logging, when at full volume in early winter, employed probably 500 horses and 1,500 men. At one point or another cutting was carried on throughout most of the year. The camps were supplied from several different directions and were loosely bound together by a system of roads and telephone lines.

CONDITIONS AT THE START.

In an established business of this kind forestry could occupy at the start only a secondary place. This fact was especially clear with regard to two important matters—the volume of the cut and the organization of the logging force.

The volume of the cut was determined by market and financial conditions, and it was approximately the same from year to year. All operations of the company had been accommodated to it, and this condition the forester could not expect to alter.

Almost as firmly intrenched was the personnel of the logging force. The men doing the actual labor of the woods were of the usual lumberman type, and in them no sudden improvement could be expected. In its woods foremen the company was, from the logging viewpoint, decidedly strong, and in its employ were a number of very effective men who had risen from the ranks through their energy and capacity; but they were, on the other hand, from the forester's view point, possessed of very decided drawbacks. They were naturally suspicious of new ideas and methods and were apt to despise small things.

The position of the forester in these circumstances was not an easy one. Forestry had to be recognized as secondary, and the forester's work had to be done largely in indirect ways. To carry out systematically any scheme based upon his ideas was impossible, and all that could be done was to strike for one or two things at a time and to work them out on the ground as best he might.

WHAT WAS ACCOMPLISHED.

With these conditions at the start, the following improvements may be said to have been due directly to the application of practical forestry to the company's tract:—

(1) Increased economy in utilizing the stock of timber standing on the land.

(2) A system of cutting adapted to the land, the timber, and the business organization, and at the same time directed toward the promotion of future growth.

(3) The heading off of a big insect depredation.

(4) A map system devised, and in large measure carried out, which renders it possible to handle a large land property with far more economy and effect than could otherwise be done.

Fire protection had been fairly well secured by the company for many years before the engagement of a forester.

ECONOMY AND WASTE.

The first thing that impressed the forester upon entering the service of the company was the great and needless waste in logging. Of the several causes to which this was due, the most important and the remediable one was that close thinking had seldom been put into this side of the work. Old logging bosses had often formed practice without regulation. Strange to say, too, the worst offenders were not the logging contractors, but the company's own men, and these often the most valued and the best. The amount of labor required to get them to pick up small items was truly surprising. This was due, however, to their training. For years they had been judged mainly by the cost of their logging. "Cheap logs, cheap logs," had been dinned into their ears until they could hardly recognize any other tune; and it consequently took two years of steady hammering before they could really believe that the company wanted them to go to extra expense to pick up inferior material.

Waste in logging occurred in the following forms: (1) High stumps; (2) large tops left in the woods; (3) the use of the axe instead of the saw; (4) trees cut and left in the woods; (5) dead or down trees which contained good lumber not taken; (6) merchantable logs used in bulding skidways, roads, and camps.

To secure complete economy it proved certain, in this case at least, that regular, frequent, and through inspection was the one indispensable thing. Supplementary to this, printed instructions were issued to foremen which covered the sources of waste just given; and where contractors were employed the question of waste was carefully dealt with in the contracts. Usually the contract specified that stumps should be cut as low as the swell of the roots, or within a specified distance from the soil; that when deep snow lay on the ground it should be shoveled from the base of the trees to be cut, or else cutting should cease entirely; that the saw should be used in place of the axe; and that lodged trees and merchantable timber used in skidways and elsewhere should finally be taken for lumber or pulp. Reform could not move too fast, however, or without clear understanding on the part of all concerned, for men might have been disgruntled and work thrown out of gear.

Greater difficulty was encountered in matters in which desired standards could not be so sharply specified. Windfalls and dead standing timber are common in the virgin spruce woods of New England, and come under this head. The trees are often defective, and are more expensive to haul than live timber, but with present lumber prices it means a distinct loss to the owner if such material is left on the ground. At the expense of a good deal of labor thrown away in testing, this class of timber was carefully picked up. In just such a case as this, where expense has constantly to be balanced with availability at the mill, was shown the utility of inspection. A thoroughly posted man was on the ground every two or three weeks during the logging season to explain requirements, settle doubtful points, and keep things up to tone. That this paid for itself was perfectly evident. If ordinary logging was costing \$4 per thousand, it might cost half as much more to pick up the windfalls and dry timber, a fact which told in the average cost of the whole cut. And yet at that figure there was a margin on even low-grade lumber, while much of the material gained was as good as the best. As a matter of fact, the rate of profit on all this class of stuff was larger than that on the main output of many other industries, while the amount saved the company would have made a handsome business for many lumbermen.

An idea of results of this system may be gathered from the following table, which shows for six logging camps the actual amount of merchantable timber cut and left on the ground. In order to ascertain what the waste was, the writer for two winters went systematically over all the roads cut from these six camps, noting every departure from the standard of economy prescribed. It will be seen that the

* Published by the Forest Service of the U. S. Department of Agriculture as Circular 131.

total loss and waste in 15,600,000 feet cut was 250,000 feet, or 1.47 per cent. Much of this, too, was unavoidable. It would have cost more than the stuff was worth to get it. The gross gain from inspection alone, without reference to any written orders, is believed to have been at least 1,000,000 board feet, which, in a cut of 70,000,000 feet, would represent a stumpage value of \$25,000.

Thus the fuller utilization of material was not brought about in the office or by any other short and easy method, but by frequent and

thorough inspection in the woods, by bringing the foremen up to time, and holding them in their turn to very careful oversight of their crews.

GENERAL MANAGEMENT.

In considering the advisability of conservative cutting the company had taken into consideration all factors for and against it, and had formulated in their own minds what they believed was the best policy to pursue in their logging work. Certain tracts where the fire risk was great, especially bordering railroads, they determined to cut clean. Land very expensive to operate they disposed of in the same way. Other tracts not seriously jeopardized by fire, and where drivable streams and the lay of the ground made lumbering fairly cheap, they determined to cut more lightly, with a view to a second crop, and perhaps later ones. This policy was the company's own, and to everyone qualified to judge it seemed then, as it seems now, a sound one.

The logging work over which the writer had regular and immediate oversight amounted to about 20,000,000 feet per year, and was scattered among ten camps, to cover which required a round trip of about 150 miles. Within this area conservative cutting was to be practised, and in every way the work was to be put on the highest practicable plane. What conservative cutting meant under the circumstances was by no means an easy matter to determine. A general diameter limit was very far from solving the problem. Things had to be settled on the ground in accordance with the circumstances of each case. The general plan followed, as nearly as it can be put on paper, was this: The mountains and ridge tops were stripped of their softwood timber because of the risk in such situations from wind. The same was done in distant corners, and on very rough ground where a logging operation necessarily involved great expense. There will be no return to such places until the appearance of an entirely new crop sufficient to make a logging operation pay. In mixed stands of hardwoods and softwoods, on the other hand, the softwoods below a diameter of approximately 12 inches were left standing. This amounted ordinarily to perhaps 2,000 feet per acre. Bunches of timber composed chiefly of young growth, with no dead or down timber, were left intact.

Spruce growth on the lower ground presented the hardest problem. If large and in dense stand there was no doubt that it must be cut clean. On the other hand, shorter and smaller stuff, well rooted as it sometimes was, could be thinned out to any extent desired. In the medium stands, however, came the opportunity for nice judgment and knowledge of local conditions. To prevent windthrow strong strips and bunches were left, roads were kept at least 4 or 5 rods apart, and sometimes trees would be left standing which from every other point of view it was desirable to cut. Frequently a third or half of all the stand remained, so that a person who did not understand what was going on would consider it the slackest kind of cutting. But that was the best that could be done unless we were ready to strip the country. Such cutting secured also the effect of thinning; not an ideal thinning, to be sure, but still of considerable practical effect.

Wind was, nearly everywhere, the big limiting and controlling factor. Spruce is a shallow-rooted tree and is therefore very liable to be thrown by wind. The Androscoggin country, too, is one most open to such loss. Virgin stands on mountains and ridge tops are frequently blown down, and in such places there is no safety whatever for thinned

timber. It was poor business to leave the stuff to blow down, for even if it went down in such quantities that the company could afford to pick it up, that would have been at increased expense. A system like that of the Black Forest, for instance, which, in spite of the skilled and detailed handling, yields on the average a fourth of the yearly product in windfalls, had it been put in operation here, would have condemned the whole system.

Such was the system finally settled on after a good deal of wear and tear, friction with logging bosses, experiment, and some mistakes involving appreciable loss. The ideal was nowhere achieved, but the main purposes of forestry, nevertheless, were carried out. This was done, moreover, without cost to the owners, because the big timber was taken out for as little or less cost per thousand than had the land been stripped. Further, enough was left, and in such shape and location that it would afford a reasonably cheap cut next time.

CREWS AND LOGGING METHODS.

Once a system of cutting had been decided upon, it became necessary for the forester to turn his attention to the actual work of getting the timber from the forest with as little injury as possible to the remaining stand.

Log hauling, except close to water, consisted of two parts—yarding or skidding and hauling on double sleds.

A yarding crew consisted usually, besides team and teamster, of 4 men, who, except for oversight by the foreman of the whole operation, worked by themselves. One man led off and made a road by cutting out trees and windfalls, filling up holes, and bridging brooks. Then followed the head chopper, ordinarily the man of most experience, who, with a man to help him, felled the trees, cut off the tops and limbs, and rolled or swung the log to where the team could pick it up. The fourth man trimmed the knots, barked the log if necessary, and helped to bind it to the sled. The men were chiefly French-Canadians and immigrants from the British provinces, with some Americans and a sprinkling of men from the northern countries of Europe.

There is no standard length of saw log in New England, as in the State of New York, but the spruce mills saw a good deal of heavy timber for framing, and in consequence desire long logs. Forty feet is a good sawing length, and a portion of the largest and straightest timber should be fifty feet or over. This meant that the logs were cut the maximum length that could be driven in the streams. Now, a spruce log two feet through the butt and 40 feet long was heavy to handle. One horse could not drag it on ordinary ground, and the men could not handle it with any degree of carefulness.

In the virgin forests a double team and a sled from 4 to 5 feet wide was used for yarding. This type of rig and the length of the logs required a broad and comparatively straight road, put through regardless of consequences. The expense of swamping, too, made it hard to treat the country in the detail that seemed best for conservative logging. Local conditions had a large influence on the felling. Big trees standing near a road had to be let down close to its line in order that the logs might be easily loaded, and this frequently entailed sacrifices of small timber. If a tree stood away from the road the usual plan of the choppers was to fell the top across it, cut what stuff stood between the butt and the road, and roll the butt log in. Frequently this process meant the sacrifice of promising young stuff. This was the more true when deep snow lay on the ground, and small stuff had to be cut and laid crosswise under the logs to prevent them from burying. Thorough logging in thick stands left the country pretty nearly a desert. In good mixed stands it was found by trial that about a third of the young growth was destroyed by the process of lumbering.

BUNCH AND STRIPWISE CUTTING.

Conservative logging, under these circumstances, to be cheap and practical had to be largely stripwise cutting. Groups and lines of big trees were taken out and of necessity a large share of the undersized timber that stood among them. Between these strips were left. These consisted chiefly of undersized trees, but also frequently contained scattering trees of good size. No sound dead trees or windfalls were left. By these methods, of course, tree-by-tree selection was seldom possible.

LINES FOR IMPROVEMENT.

In any improvement in the logging organization the important influence to reach was clearly the foreman. He was in the best position to lay out the work as it came along—the man, therefore, who had to be

trained and to whom directions should be issued. At best the forester could not be on a job but once in a couple of weeks and therefore could guide the operations only in a general way.

But foremen had to be vastly sharpened up in their ideas about their duties. Many of the older men had been practically undisturbed in their sphere for years and had fallen into the habit of visiting their crews about once a day and spending the rest of the time, if they felt like it, in camp. For a new man to bring about a change in this matter was, of course, delicate work. The best weapon at hand was thorough inspection, which meant going over the work regularly and thoroughly, taking note of every item of waste, watching for stuff left standing that was likely to blow down, showing the man on the spot just where his work failed from the ideal, and leaving in the camp a written report—a duplicate of which was sent to the office—of just what was found. There was sometimes a surprisingly quick and striking result from this system.

LOCATION OF ROADS.

A factor which had much to do with the cutting of the timber was the location of the roads. When these had once been spotted out it was determined what was to be cut, and, if a thinking man located them, he could be of good service keeping them away from bunches of young timber. The spotting of yarding roads, therefore, was taken away from the choppers, whenever possible, and given to the foreman. The old system of road running was also modified. As few roads as possible were to be employed, so a greater number of branch roads were run, in modification of the old parallel system.

MARKING AND FELLING.

Marking the timber to be cut ahead of the operations was, after a fair trial, found to be ineffective and unsatisfactory. The foremen would take no interest in it themselves, and nothing else made the old loggers so angry or so destroyed their interest in their work. Further, it was found that in the company's timber and under the existing conditions, marking could hardly be done to advantage ahead of the operations, especially in advance of the location of the roads. The wind question, for one thing, was too fine a one. A man could not tell how the resulting stand was going to look until it was actually opened up.

Moreover, with an active, interested foreman, one who understood what was wanted in the way of cutting, marking the timber was not essential to secure a very fair result. A foreman who was with his crews several times a day could get just about such trees cut as he wanted, and in that way, also, he could see how the cutting looked as it went along. An inspection of each road before the choppers left it was a regular feature of the foreman's duties. If any defective trees had been left, or any that he thought would blow down, it was not too late to get them out.

There were some tricks in felling, designed to save small growth which the men could learn and apply. Sometimes a big tree could be let down equally well in two or three directions, and the chopper, if he would notice in which direction promising young growth stood, could save it. Occasionally there would be a chopper among the crews who could be got to do that. Another good and inexpensive plan was to fell the heavy-crowned spruce directly into the roads, where they would do no damage. If they lay at an angle with the road they could be dragged in by the team instead of being rolled over the young growth. If the log in this position made a hard pull, they took it first and made up the load below. Sometimes a more distant log might be dragged out with a chain, and the cost of this labor was often more than offset by the saving in the cost of swamping.

Lastly, much could be done for the woods in every direction—in economy, in effective thinning, and in favoring the resulting stand, by starting operations early and stopping the cutting work in January, before the advent of deep snow. A foot of snow ordinarily makes the best and cheapest logging, but deep snow impedes good work.

The gains made by these means may look to be of small consequence, like nibbling around the edge of the matter instead of striking at once for its core. But the measures outlined, when persistently carried out, had appreciable effect on the condition in which land was left and on its consequent value. Moreover, whatever was accomplished by these means was without a dollar of cost to the owners of the land. The future of their business was a little more secure and their immediate profits were no less.

No statement of the gain expected from the policy pursued will be given here. It seems sufficient to state that the company feels reasonably secure and satisfied.

CONTRACT LOGGING.

When logging was done by contract, the clauses under which careful and conservative cutting could best be secured were as follows:—

The contractor agrees and contracts with the company to cut, haul, and deliver into River all the spruce and fir timber of description given below in the Valley. The timber to be hauled at the rate of 2 1-2 million feet a year, and the bounds of the valley to be determined by a spotted line run on the height of land by the company's inspector.

All spruce fir trees over 12 inches in diameter breast high shall be cut, but no trees under that size unless in the necessities of hauling contract timber. But this rule may be varied by the company with a view to leaving the land in good growing condition. To this end the contractor agrees to cut the land clean or to refrain entirely from cutting where directed to do so by the company's inspector.

Windfalls that are sound shall be hauled, and all standing dry timber that is suitable for boards. Such dry timber shall not be discounted for sap rot but shall be scaled like green timber.

The contractor in laying out and cutting roads, in felling, and in all other operations, shall use all reasonable care in protecting from damage all spruce and fir trees that are smaller than contract timber. To this end he shall instruct his employees and give them diligent supervision. When trees under contract size are broken or cut down of necessity, they shall be hauled, down to the size of 5 inches in diameter at the top and 16 feet long.

The timber shall be sawed down, and the saw shall be used in cutting off logs except the top cut.

All trees shall be cut as near the ground as the swell of the roots admit, the snow being removed, if necessary, to effect this result.

Trees shall be run up to 5 inches in the top.

All fir logs shall be cut sound at both ends.

No logs more than 40 feet long shall be hauled. Crooked logs that are longer than that shall be cut in the crook. From straight trees over 40 feet long and under 52 a 12-foot top shall be taken; all over that shall be cut with a butt log 40 feet long.

No merchantable spruce shall be used for camp buildings or for firewood. No spruce or fir trees shall be used for roads, bridges, bedding, skids, slides, or other purposes when other material is to be obtained. When so used they shall, if of merchantable size, be hauled in.

For all trees left lodged, for all logs left in the woods, for all waste stump and top, for all merchantable timber left in yards, roads, or bridges, the contractor agrees to pay at the rate of dollars per thousand.

Any differences of opinion as to the operations carried on under this contract that can not be adjusted by the parties to it shall be adjusted by , whose decision shall be binding and conclusive upon them.

DESTRUCTIVE INSECTS CHECKED.

At the time the writer first entered the upper Androscoggin basin, the country south of the Rangeley Lakes was practically free from insect depredations. North of the lake system, however, damage in many places was severe. The best field for insects was in the virgin timber, and much of great value was either involved or threatened. The insect which caused the damage was a small, black beetle that killed the trees by cutting channels in the inner bark. Ordinarily the insects spread from one tree to others in its neighborhood, and thus clumps of dead or infested timber would be scattered over a valley. It was only occasionally that young broods spread far from their base. This was clearly shown by the fact that bodies of timber which were separated from the infested places by areas of cut-over lands had escaped attack. Even the width of Parmachenee Lake had long proved an effective barrier, though the insects finally attacked the fine timber on its western shore.

The chief measure of relief was plain—to cut and drive the dead and infested timber, in order both to save the lumber and to drown the beetles. The company, of course, could not send crews over its vast holdings to search for small clumps of dead and infested trees; indeed such strenuous measures did not appear necessary. Certain things

could be done, however, which were both profitable and practicable. These were: (1) To at once direct the regular logging operations into the heavily infested valleys, taking crews when necessary from those free of insects; (2) to locate in each valley that was being logged, the stands of insect-killed timber, and, when they were within reach, to cut them ahead of green timber; (3) wherever it would pay, to begin special operations to get out the dead timber, with such other material as it would be necessary to take with it.

To carry out these measures, however, required persistence and great labor. The company was very cautious about changing the principles which had guided its operations, and when its consent to a change was secured came the work of carrying it out on the ground.

Yet the remedial work indicated was in large measure carried out, and the dead and infested timber was put through the mill, though the work was not done with either the promptness or the thoroughness that would have been desirable. However, much of value to the company and to the region was accomplished. Much valuable timber was rescued from decay, and insect depredations were reduced to insignificant proportions. What this saved the company is very hard to estimate. Certainly it was more than \$100,000. But whatever the saving, the credit for it must lie with the application of forestry.

To-day there is little danger from insects on the tract. The larger colonies of beetles were taken out by the logging, and the woodpeckers and other enemies of the insects keep the lessened numbers in check. Moreover, the region has learned and digested an important lesson. Probably twenty woodsmen understand thoroughly the work of the beetle in all its practical bearings. From now on they will be on the watch, and serious trouble, if it should appear, will not escape them. It is safe to say that if the tract remains under continuous management, no serious damage from this source will ever occur again.

TIMBERLAND MAPS.

One of the greatest needs of the company was an adequate system of maps. Thorough first-hand knowledge of its vast holdings was too much for one man to acquire and retain. Spread out as they were, over hundreds of miles of territory, the most efficient management was necessary if things were to be kept moving, without loss of time or materials.

The whole extent of the timber resources of a property must be really grasped and subjected to intelligent control. There is such a thing as handling a country to good or to bad advantage from the point of view of timber resources. A knowledge of the health of the timber in different parts of a property will tell immensely in the profit reaped. A tract may be caught for logging in the pink of condition, or it may be allowed to stand through a period of decline until a large proportion of its value has been destroyed. This question of "ripeness" has no less influence on profit than the market timeliness of operation.

There is also great variety of circumstance which must be clearly known if logging operations are to be conducted in the most effective way. Such points are the size of the various valleys and the amount of timber in them, the steepness of slopes and the character of the bottom as affecting logging, the chances there may be for roads and the advantages and disadvantages of these as regards grade, cost and liability to overflow, the capacity of landing ground, facilities for driving, and the quantity that may be driven out of streams. All these and many other points must be taken into account if the most economical operation is to be secured. Accurate, systematic knowledge on all these points pays over and over again in the saving on poorly directed labor.

In the business of the Berlin Mills Company, at any rate, full and accurate maps have proved their serviceability. They have been used to locate camps and roads, to let contracts by, to plan operations of all kinds. It took a little time to learn how to use this system, but those who have persisted so far as to realize its benefits would not now part with it for several times its cost.

The lands of the company lay for the most part in townships that had never been subdivided. It was first settled that these should be divided into mile squares, a system of survey that has been found very serviceable for the help it gives in estimating timber and in laying out roads. This was work for the compass and chain. Into the framework so obtained the detail features of the country could readily be put by one man working alone, using the method of compass and pacing.

The examination of the timber could be done in connection with this, and largely at the same time.

The next essential was to construct a contour map. Such a map looks very intricate to the uninitiated, but in reality its production was not a difficult or costly matter. Since the controlling factor was cost, the aneroid barometer was the instrument chiefly used in the work. By the methods employed, the topography was obtained at the same time that the man did the surveying and crusing.

The facts regarding a timber township were divided into two classes and represented on two sheets. One sheet contained permanent features, such as property lines and lines of subdivision, permanent roads, waters, and the contours. The other embodied facts regarding the timber. These included the character of the timber and estimates of stand. Camps and supply roads were, of course, located. These sheets were drawn on tracing linen, so that one may be laid over the other and the topography and the timber seen in direct relation.

In addition, the map system was supplemented by topographic models, which showed in miniature the land just as it lay. These were a great satisfaction to the company, and were clearly understood by strangers and lumbermen, where contour maps might not have been.

As to cost, the whole operation, renewal of outside boundaries, division into mile squares, timber examination, and topographical mapping—the whole represented in model and maps—was carried out for less than \$1,500 per township. A good deal more might, of course, have been spent, and in easier or less valuable country a sufficiently good result might have been obtained for less.

The map system, supplemented as it was by a man to map in the cuttings, renew lines, and keep watch of the timber, was of benefit to the company in the following ways:—

(1) Operations could be planned and largely controlled from a central point. The cut could be located for years ahead, and with full consideration for the most economical driving and hauling of supplies.

(2) The location of all roads, whether logging roads or supply roads, was greatly facilitated. Exploring was saved and distances were accurately known.

(3) Great saving in the aggregate was effected through the detection of small losses such as windfall and insect depredation, and by knowledge of the location of bodies of unhealthy timber.

(4) Information about the tract could be preserved in permanent form. Many old lumbermen or cruisers possessed knowledge of the holdings which would have been lost when they died or stepped out, unless maps were at hand.

(5) Working knowledge of the territory could be gained by a new manager within a year, when otherwise he might be in the hands of his employees for a long time.

(6) The company could show its stockholders, investors, and directors just what property it was possessed of.

ANNUAL CONVENTION OF FORESTRY ASSOCIATION.

The annual convention of the Canadian Forestry Association will be held in Montreal on March 12 and 13 next. Among the guests will be His Excellency Earl Grey, Sir. Wilfrid Laurier, Mr. R. L. Borden, Archbishop Bruchesi, Mgr. Laplamine and many other prominent Canadians. Delegates are to be asked from the Quebec Fish & Game Club, with the idea of showing this organization the value to them of forest preservation. A paper on this subject will probably be read by one of the club's delegates.

As usual with the Forestry Association, the main subjects under discussion will deal more particularly with the forestry interests of the province in which the convention is held, so that there is no doubt a great deal of valuable material for those interested in the forest resources of Quebec will be brought out.

The coming convention will be unique in the annuals of the association, inasmuch as they will be bi-lingual. Hitherto the work of the association has always been done in English, but in recognition of the large French-Canadian interests in the forest products of this province, the French-speaking people will be asked to attend, and when advisable carry on the discussion in their own language. In addition to this, the official reports of the convention will be published in both French and English, and in this way it is hoped to secure a wider sphere of interest in this province than otherwise might be possible.

CHANGE IN CANADIAN TIMBER REGULATIONS.

Sections 1 to 10 of the regulations which have been in force since July 1, 1898, for the granting of licenses to cut timber on Dominion lands in Manitoba, Saskatchewan, Alberta and the North West Territories and within 20 miles on either side of the main line of the C.P.R. in British Columbia have been rescinded, together with all amendments and additions made between that date and December 19th last. The new regulations are as follows:—

DISPOSAL OF LICENCES.

1. Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan and Alberta, the North West Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia and in the tract of three and one-half million acres to be located by the Government of the Dominion in the Peace River district in the Province of British Columbia lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public action at the office of the Dominion Timber Agent for the district in which the berths are situated.

2. Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles and each of such berths shall be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government, who shall make as exact an estimate as possible of the quantity of timber on the berth, ascertain its general condition, its accessibility, and any other matters that may be necessary to determine the value of the timber and to enable the Minister of the Interior to fix an upset price, and shall furnish a report thereon under oath to the Minister. The Minister shall then fix an upset price at which the berth shall be disposed of and no berth shall be sold at less than the price so fixed.

3. No license shall be disposed of until notice of the sale has been given for a period of not less than sixty days in a newspaper published in the district in which the berth is located, and also in a newspaper having a general circulation in the Province.

4. There shall be kept in the Department of the Interior at Ottawa a list of persons to whom notice of all sales of timber shall be sent. Any persons making application in writing shall be entitled to have his name placed on the said list and no name shall be removed therefrom until after the expiration of sixty days from the date of a notice to be given in writing to the person so named and sent by mail to his last known address.

5. The notice of sale shall give the distinguishing number, the description and area of the berth, the upset price, the place and the day and hour at which such sale is to be held.

6. Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars, shall be paid one-half in cash at the time of sale and a note or notes shall be given for the remaining half of the purchase price payable in three months with interest at the rate of five per centum per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale and notes shall be given for the remaining two-thirds of the purchase price payable in three and six months with interest at the rate of five per centum per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at the time of sale and notes shall be given for the remaining three-fourths of the purchase price, payable in three, six and nine months with interest at the rate of five per centum per annum. Notes given as herein provided shall be made payable at a bank in the city or town in which the sale is held or at a bank in the City of Ottawa. Cash payments must be made at the time of sale in legal tender or by a draft issued by a chartered bank payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

(b.) The purchasers must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

7. Persons to whom berths are awarded at a sale shall sign a contract agreeing to carry out and complete the purchase on the terms and conditions of sale according to the following form:—

District of _____ Berth No. _____ I,
of _____, having bid for the berth aboved named the sum of \$ _____
dollars, and said bid having been accepted, do hereby

promise and agree to carry out and complete the same forthwith in accordance with the terms and conditions of sale as set forth in the notice of sale dated at _____ the _____ day of _____ and in the regulations for the disposal of timber under the licence established by His Excellency the Governor in Council.

Witness:

LICENCES.

8. No license for any timber berth shall be issued until the full amount of the purchase price, the cost or estimated cost of survey, and the ground rent for the first year have been paid.

(b.) The licensee shall be entitled to a refund of any amount over paid on account of the survey of the berth, and if the amount paid on this account at the date of sale is not equal to the cost of survey as finally determined he shall pay such additional sum as may be necessary to make up the full cost of survey.

9. All timber licenses shall expire on the thirtieth day of April next after the date from which they are granted.

10. The license shall vest in the licensee, subject to the conditions mentioned in the license, all right of property whatsoever in all trees, timber, lumber and other products of timber which he is entitled by the license to cut, and which have been cut within the berth during the continuance thereof, whether such trees, timber, lumber or other products be cut by authority of the licensee or by any other person with or without his consent; and shall vest in the licensee, as against any person other than the Crown in the right of the Dominion, subject to the conditions mentioned in the license, all right of property whatsoever in all trees, timber lumber and other products of lumber cut within the berth during the continuance thereof by any other person without his consent; and shall entitle the licensee to seize in replevin, revendication or otherwise, as his property, timber of any kind cut upon the berth, where the same is found in possession of any unauthorized person, and also to bring any action or suit at law or in equity against any person unlawfully in possession of any such timber, or of any lands within the berth, and to prosecute any person to conviction and punishment for any offence in connection with such timber or land, and all proceedings pending at the expiration of the license may be continued and completed as if the same had not expired.

11. A license shall be renewable from year to year while there is on the berth timber of the kind and dimensions described in the license in sufficient quantity to be commercially valuable, if the terms and conditions of the license and the provisions of the Dominion Lands Act and of the regulations affecting the same have been fulfilled:

Provided that such renewal shall be subject to the payment of such rental and dues and to such terms and conditions as are fixed by the regulations in force at the time renewal is made.

12. Whenever any portion of a timber berth has not upon it timber of the kind and dimensions described in the license in sufficient quantity to make it commercially valuable, the Minister of the Interior may, after an inspection has been made, declare such portion fit for settlement and withdraw it from the berth and from the operations of the license covering it:

Provided that no withdrawal shall be made unless the licensee has had sixty days' notice thereof; and that the Minister of the Interior is satisfied that the same can be made without unduly interfering with the operations of the licensee on the berth, and that, upon such withdrawal, the ground rent shall be reduced in proportion to the area withdrawn.

13. If the Minister of the Interior ascertains after an inspection has been made, that any land within a timber berth is fit for settlement and is required for that purpose, he may require the licensee to carry on the cutting of timber provided for by clause 33 of these regulations on the said land, on the expiration of the time within which the timber which the licensee is entitled to cut should be removed therefrom, may withdraw such land from the berth and from the operations of the license covering it.

14. If the survey of any timber berth heretofore granted or which may be granted hereafter is not completed at the expiration of the period fixed in the advertisement of the sale of such berth or, in the absence of such provision in the advertisement, by the thirty-first day of December, 1907, such failure to complete the survey shall be deemed an

THE Wood-Worker and Retailer

LOG BAND SAWING.

By AN ONTARIO MILL SUPERINTENDENT.

Some time ago the columns of this valuable journal gave a good deal of attention to the respective merits of the various machines in use as modern lumber producers. An inspection of many mills and the products thereof, located from the Atlantic to the Pacific, has firmly convinced the writer that the best machine in use to-day for any kind of log (except "stoned" pick ups) is the double cutting band saw—used as a single cutter on good lumber and as a double cutter on cull pine, spruce, balsam, hemlock, cottonwood and other inferior lumber. Properly handled, and installed, this machine will produce more value from a run of logs than any other. Such machines as the live gang, twin circulars and gang, gang and edgers, band gangs and circular or rotary saws have no place in the real economical production of lumber, when compared with the band mill. They will either produce inferior grades or waste in kerf. Ultimate results will be entirely in favor of the double cutting band used as above.

Some operators may not endorse this opinion, but it can be easily proved both in theory and practice. Now, the writer would like to make some remarks as to the proper methods of caring for a double cutting band mill in order to produce results.

The band mill itself should rest upon a first class foundation and if the wheels are in proper balance should run without vibration. This is an important matter, as a shakey mill cannot do the best work. If your band mill shakes take off the saw—speed up the lower wheel and thus ascertain whether the fault lies in the lower or upper wheel. Too much care cannot be exercised in getting a good balance on band mill wheels and all sawdust and bark should be scraped off—a little kerosene applied to the surfaces helps wonderfully in keeping the surfaces clean.

It is well to "set" up all bolts, screws or other fastenings which hold the upper frame to the main husk of the band mill and also to "take up" all unnecessary slackness in the slides, both on the sliding frame and journal carriers.

Keep the faces of both upper and lower wheels perfectly straight across so that the saw will strain up properly. There are good grinders on the market for this purpose. And there are poor ones. A good grinder can be set up on the frame of any band mill and bolted or screwed thereto. Both wheels can be ground at one setting. Avoid any grinder that has to be tipped up and blocked with shingles, etc. It is not mechanical.

Very important parts of the band mill are the saw guides. Both upper and lower guides should be made to swing on a pivot, located about half way across the face of the saw, this provision being made in order to lead the saw either in or out of the log a trifling amount, to make both the forward and backward cuts of a uniform thickness. These guides should be so made that they can be opened instantly by the pull of a lever within reach of the sawyer. This is especially needful when sawing such material as hemlock. It will be found useful too when changing saws.

The lower wheel shaft should sit level and in alignment with the V or guide rail of carriage. The upper wheel should align with the lower wheel in every respect, both on the face and on the edge. The saw line should be plumb, and the slides, on which the upper guide travels, should be plumb too, so that when the guides are adjusted to the saw at the lower end of the slides, they will fit equally well when raised to the extreme upper end.

These are the main points to observe in setting up the machine. The log carriage for the double cutting band mill cannot be too well made nor too well looked after if the best results are to be obtained.

Nine-tenths of the saw culls made on band mills are caused by ill conditioned carriages or tracks.

Track timbers should be firmly bolted down and keyed. Be sure they are so fastened, as any tip over or movement of the V or guide rail will surely cause bad lumber.

Set the rails straight and level. Bolt them down, especially the V or guiding rail.

The carriage truck wheels should run perfectly true—they should be turned after being keyed on. The V wheel should fit the V track as closely as possible and the axles should be square with the tracks, as otherwise there will be a tendency to crowd sidewise at every reversal of the sawyer's lever. Also, see that there is no undue slackness between the truck boxes and truck wheels. Set the pinions of the set shaft in mesh with the toothed racks of the headblocks, so that there will be no lost motion between the teeth of the gear and those of the rack. Now, take up all the "lost motion" in the taper movement and put the set works in first class shape so that there will be no "lost motion" between the setter's lever and the set wheel.

With a mill in first class condition and with good saws, lumber can be sawn much thinner than is usually done and a big saving thus effected, the greatest saving being on large logs; but even on small logs (eight inches and up) the money expended in the proper maintenance of the machinery will realize large dividends.

Do not use a thicker saw than 14 gauge on an 8-foot wheel. Get a good filer and give him the best equipment you can buy to keep his saws in shape. Employ a good sawyer and an accurate setter. Be sure they are men whom you know can produce results and your "saw culls" will not worry you. In preparing sawing instructions for your sawyer, impress upon his mind the importance of getting the most value out of the log. Give him a clear and definite idea as to the value of the different grades he makes.

There are some lumbermen who have their logs sawn by others at a price per thousand. They pound the mill operator down to the last cent on the saw bill and lose thousands of dollars per year by slaughtering their lumber in gangs and cutting up alive. Sawing to grade is not the cheapest way to saw, but it is most profitable in the final result to the man who owns the output.

During the past few years, the demand for lumber has been so keen that grades have not been scrutinized as closely as they are now, neither has the manufacturing standard been kept up to the highest point. Now comes the time when it is up to the mill man to produce the goods—good goods too, or piles of age blackened lumber will grace his yard and silently testify to their owner's lack of ability as a lumberman.

A SUGGESTION FOR GRINDING TOOLS.

The common methods and appliances for grinding edged tools, as chisels and planers, in the ordinary shop are often far from satisfactory and devoid of proper results. It takes more skill than is possessed by the average workman to grind properly the cutting edge of a plane-iron or chisel, by holding the tool in his hands against the grinder without the aid of any other support or guide. Attachments for properly guiding the tool during the grinding process can be purchased, but they are usually put in the list of things "we can get along without." Workmen sometimes mount an emery wheel in a lathe or on a bench and, by the aid of the rests and some hand devise for holding the tool, let the lathe do the work. Mr. Isaac P. Smithe, writing in "Wood Craft," says this latter method is treacherous and risks the finely tempered edge of the tool to damage or destruction. He suggests the home-made

device shown in the illustration for holding a plane-iron, chisel, spoke-shave, iron, gouge, axe, or other edged tool, when grinding on a grind-stone.

The bar A is made of 1 1/4 or 1 inch stock, about 2 1/2 inches wide and 3 1/2 feet long. The left-hand end (referring to the engraving) is shaped into a handle as indicated in the top view of the handle. Into the other end of the bar is driven a common screw turned home to the depth of the threads. The head of the screw is clipped off and the end of the shank filed rounding for a pivot.

The block B, 4 or 5 inches long, and the width of A, is screwed to it

Steady Brace for Grinding Tools

and carries the tool to be ground. In this case the tool is a plane-iron clamped with a thumb-screw. On to the post just back of the grind-stone has been screwed a strip of 3/8 by 1 inch iron, into which has been drilled a series of holes, part way through, one under the other, about 3/4 inch apart, and numbered. When the plane-iron has been clamped to the block so that the cutting edge is not more than 1 inch ahead of it, the pivot is set in any hole and the iron dropped on the stone. A few seconds of grinding will show the new bevel and if this should not be what is wanted, set the pivot in another hole and try again. Not more than one or two changes will usually be required. When the proper hole has been found, note its number.

With this device the stone may be turned by one hand and the tool

NEW PLANER AND MATCHER.

The Goldie & McCulloch Company, Limited, of Galt, Canada have recently put on the market a new planer and matcher to meet the modern requirements of the trade. This machine is intended for all kinds of planing and matching from 2 in. to 14 in. wide and 6 in. thick. It is strongly built, neat and compact. The frame being cast in one piece insures rigidity and constant alignment. The cylinders carry four knives and are each driven by two belts, the lower one being placed in front of the upper, trueing the stock before reaching the top head platen. This feature is especially valuable for hard wood flooring or band saw stock.

The side heads are of the new and improved Philbrick pattern with inserted cutters specially designed for this work. They are carried on strong brackets with the latest and best adjustments. The spindles run in long self oiling bearings. When repairs are necessary the brackets are easily detached and lifted clear of the machine. All pressure bars are bolted to the brackets, thus insuring a uniform pressure.

All feed rolls are 10 inches in diameter, of easy alignment in case of unequal wear. The upper ones are carried in hinged yokes which allow a lift of about 3 inches. The lower feeding rolls are under control of the operator in front of machine. All rolls are driven by machine cut gear and are well protected. Pressure bars about all cutters are adjustable to and from the work, that above the lower cylinder being sectional to allow for irregularity in rough timber.

Countershafts are separate from machine and all run in substantial self oiling bearings. The cylinders should run 4,000 revolutions, the ratio of feed varying from 46 to 120 feet per minute.

Those who are in need of a machine of this description or who wish to add to their present capacity, would do well to personally acquaint themselves with the merits of this new planer and matcher. All information and illustrated booklet will be sent upon request. See their advertisement on page 11.

NO MORE HAND LOGGERS' LICENSES.

The British Columbia Government have decided to discontinue the issuing of licenses to hand loggers. In the meanwhile it is said that the department is refusing to issue the licenses for which application has already been made.

NEW PLANER AND MATCHER MANUFACTURED BY THE GOLDIE & McCULLOCH COMPANY.

managed with the other. Even on a power-turned stone, one hand is better than two. The tool may be turned over as many times as desired in the process of grinding to note its progress and it drops back on the same bevel when replaced. Should the pivot slip out of the hole, be sure and replace it in the same hole. The arrangement is rapid and accurate, and even in the hands of a boy it is quickly mastered and gives the best of results. With this device 30 2-inch plane-irons have been ground in less than an average of two minutes each, and many of them were in bad shape.

The move is in accordance with the Government's policy of preserving such timber as is not under lease or license as yet. It was felt that with the reserve placed on timber lands by the recent Order-in-Council, it would be unfair to permit the hand loggers to operate even though the timber affected is inappreciable as compared with that touched by the former order. Were hand loggers' licenses still issued there would be nothing to prevent the exploitation of the richest timber lands in this manner. Hand logging outfits would soon be scattered broadcast throughout the province stripping the reserve timber land of the more valuable sticks.

CHANGE IN TIMBER REGULATIONS.

(Continued from Page 21.)

infraction of these regulations and shall render the licensee liable to forfeiture as provided therein.

(b.) Provided, however, that the Minister of the Interior may, instead of declaring a berth forfeited for failure to complete the survey thereof, require the licensee to pay to the Crown the sum of ten dollars for each day after a date to be fixed by the said Minister by notice mailed to the licensee at his last known address, during which the survey shall remain uncompleted, and such sum shall be payable whenever demand is made therefore by the proper officer of the Department of the Interior.

15. If, in consequence of any incorrectness in survey or other error or cause whatever, a timber berth is found to comprise lands included in another berth awarded at a prior date, or any lands sold, granted, leased or lawfully set apart for other purposes under these regulations or The Dominion Lands Act, the latter berth shall be void in so far as it interferes with any previous sale, grant or setting apart.

16. Any right to a timber berth cannot be assigned or transferred without the consent of the Minister of the Interior. The fee for the registration of an assignment of a timber berth or of any interest therein shall be at the rate of one dollar for each square mile covered by the berth, but in no case shall such fee be less than two dollars.

This license shall vest in the licensee, subject to the conditions mentioned in the licence, all right of property whatsoever in all trees, timber, lumber and other products of timber which he is entitled by licence to cut, and which have been cut within the berth during the continuance thereof, whether such trees, timber, lumber or other products be cut by the authority of the licensee or by any other person with or without his consent; and shall vest in the licensee as against any person other than the Crown in the right of the Dominion, subject to the conditions mentioned in the licence, all right of property whatsoever in all trees, timber, lumber, and other products of lumber, cut within the berth during the continuance thereof by any other person without his consent; and shall entitle the licensee to seize in replevin, revendication or otherwise, as his property, all timber of any kind cut upon the berth where the same is found in the possession of any unauthorized person, and also to bring any action or suit at law or in equity against any person unlawfully in possession of any such timber or of any lands within the berth, and to prosecute any person to conviction and punishment for any offence in connection with such timber or land, and all proceedings pending at the expiration of the licence may be continued and completed as if the same had not expired.

The licensee shall take from every tree he cuts down all the timber fit for use and manufacture the same into sawn lumber or some such saleable product, and shall dispose of the tops and branches and other debris of lumbering operations in such a way as to prevent as far as possible the danger of fire in accordance with the directions of the proper officers of the Department of the Interior.

The licensee shall prevent all unnecessary destruction of growing timber on the part of his men and exercise strict and constant supervision to prevent the origin or spread of fires.

The licensee shall furnish to the Dominion Timber Agent having jurisdiction in the matter at such periods as may be required by the Minister of the Interior or by regulations under The Dominion Lands Act, returns sworn to by him or his agent or employee, cognizant of the facts, showing the quantities manufactured, sold or disposed of, of all sawn lumber, timber, or any other product of the timber from the berth with the exception of slabs and sawdust, in whatever form the same may be sold otherwise disposed of by him during such period, and the price or value thereof.

In lieu of or in addition to the returns provided for by the preceding clause, the Minister of the Interior may require that every licensee shall furnish during each year to the Dominion Timber Agent having jurisdiction in the matter at such periods as may be required by the Minister of the Interior, through himself, his scaler or foreman, or through all of them, a statement in writing in detail, under oath, setting forth the number of pieces of timber, saw-logs and other material cut, caused to be cut or taken under his licence during such period, and the correct contents in board measure of the same, as shown by Scribner's log rule, if the timber has been cut in Manitoba, Saskatchewan, Alberta,

or the Northwest Territories, and by the British Columbia log scale when cut within the railway belt of British Columbia:

The licensee shall pay, in addition to the said ground rent, dues in the manner prescribed in Section 21 of the Timber Regulations, and also one-half of the cost incurred by the Crown in guarding the timber from fire, the Government paying the other half. A statement will be furnished the licensee showing his share of the cost incurred and payment thereof shall be made to the Crown within thirty days thereafter.

The licensee shall keep a "lumber sales book," in which shall be entered all sales of the products of the berth, both cash and credit sales, also a book accounting for the number of feet of sawn lumber manufactured each day at the mill, with the day and date; all books and memoranda kept at the logging camps shall be carefully preserved, and these and other books kept by the licensee in connection with his lumbering business he shall submit for the inspection of the Dominion Timber Agent or other officer of the Crown whenever required for the purpose of verifying his returns aforesaid.

This license shall be subject to the right of the Crown to deal in accordance with the provisions of the said Act, and the regulations made under it by the Governor in Council with any and all stone, coal and other minerals found within the limits of the berth licensed; and the Crown shall have the right in dealing as above provided, with any stone coal or other minerals in lands licensed as timber limits to authorize the persons to whom such stone, coal or other minerals are granted to take possession of and occupy such extent of land so licensed as is necessary to work such stone, coal or other minerals, and to open necessary roads through any such timber berth, paying the licensee of the berth the value of any and all timber of a diameter of ten inches at the stump and upwards, necessarily cut in making such roads or in working the quarries or mines, such value in case of dispute to be fixed by the Minister of the Interior; and the provisions of this clause shall operate irrespectively, that is to say: they shall apply to all licensees of timber berths heretofore granted under any Act respecting Dominion lands, as if they had been contained in such Act when it was passed.

This license shall be subject to forfeiture on the order of the Minister for violation of any of the conditions to which it is subject or for any fraudulent return.

RENTAL AND DUES.

18. The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rental shall be five cents per acre.

19. Within thirty days after the date of awarding a timber berth the person in whose favor it is awarded shall pay rent for the year in advance, and if not then paid the said rent shall bear interest at the rate of five per centum per annum from that date until the same is paid.

20. The licensee shall pay the following dues on timber cut on his berths:

Sawn lumber, fifty cents per thousand feet board measure.

Railway ties, eight feet long, one and three-quarters cents each.

Shingle bolts, twenty-five cents per cord.

And five per cent. on the sale of all other products of the berth;

Provided, however, that the licensees will not be required to pay royalty dues on the sale of slabs or on sawdust.

(b.) Licensees of timber berths may be permitted under the supervision of an officer of the Department of the Interior to cut and remove burnt timber from their berths on payment of one-half the dues prescribed by the regulations.

21. One-half the cost incurred by the Crown for guarding the timber from fire shall be defrayed by the licensee thereof, the Crown defraying the other half.

22. All ground rents, royalties or other dues on timber cut within the boundaries of any timber berths which are not paid at the time when they become due, shall bear interest at the rate of five per centum per annum until paid, and shall be a lien on any timber cut within such limits or on other Dominion lands by the licensee or his agents; and in case of such non-payment—whether in consequence thereof the license of the berth has or has not been cancelled—the Dominion Timber Agent or other person authorized thereto may, with the sanction of the Minister of the Interior, seize so much of the timber cut on such berth or other Dominion lands by the licensee or his agents as will, in his opinion, be

sufficient to secure the payment of such rent or royalty and all interest and expenses of seizure and sale, and may detain the same as security for the payment thereof; and if payment is not made within three months after seizure, he may, with the sanction of the Minister of the Interior, sell such timber by public auction; and after deducting the sum due to the Crown, the interest thereon and expenses aforesaid, he shall pay over the balance, if any, to the licensee, if the timber was in his possession at the time of the seizure, or if it was not, to the person who had possession thereof at the time. Provided that if no bid equal to the amount due the Crown is made at such public auction such timber may be disposed of at private sale.

22. All timber cut under license shall be liable for the payment of the Crown dues thereon, whenever and wherever the said timber or any part of it is found, whether it is or is not converted into deals, boards or any other manufacture of wood; and all officers or agents employed in the collection of such dues may follow all such timber paid or secured, as provided in the next preceding section.

24. If the payment of the dues on any timber has been evaded by any licensee or other person, by the removal of such timber or products out of Canada or otherwise, the amount of dues so evaded and any expense incurred by the Crown in enforcing payment of the said dues under the Dominion Lands Act may be added to the dues remaining hereinbefore provided; or the amount due to the Crown, of which payment has been evaded, may be recovered by action or suit in the name of the Minister of the Interior or his agent, in any court of competent to be collected on any other timber cut on any timber berth by the licensee or by his authority, and may be levied and collected or secured on such timber, together with such last-mentioned dues, in the manner jurisdiction.

RETURNS OF MANUFACTURE.

26. The licensee shall in each year furnish to the Dominion Timber Agent having jurisdiction in the matter at such periods as may be required by the Minister of the Interior returns sworn to by him or his agent or employee, cognizant of the facts, showing the quantities manufactured, sold or disposed of of all sawn lumber, timber, or any other product of timber from the berth, with the exception of slabs or sawdust in whatever form the same may be sold or otherwise disposed of by him during such period and the price or value thereof.

27. In lieu of or in addition to the returns provided for by the preceding section of these regulations, the Minister of the Interior may require that every licensee shall furnish during each year to the Dominion Timber Agent having jurisdiction in the matter at such periods as may be required by the Minister of the Interior, through himself, his scaler, or foreman, or through all of them, a statement in writing in detail, under oath, setting forth the number of pieces of timber, saw-logs and other material cut, caused to be cut or taken under his license during such period, and the correct contents in board measure of the same, as shown by Scribner's log rule, if the timber has been cut in Manitoba, Saskatchewan, Alberta, or the North West Territories, and by the British Columbia log scale when cut within the Railway Belt of British Columbia.

28. It is required that all licensees, through themselves, their scalers and foremen, shall furnish proofs on oath on the first day of May of each year, or at such other time as the Minister of the Interior may direct, as to the exact locality, by a ground sketch, where all timber, saw-logs or other lumber cut by themselves and others, to their knowledge, upon the timber berth held or occupied by him or them, respectively, have been cut.

29. All timber before being put into any stream or lake to be floated to the mill must be marked with a stamp furnished by the licensee and approved by the Dominion Timber Agent, a copy of said stamp to be placed on record in the Dominion Timber Office.

30. On the arrival of any raft, or parcel of timber or saw-logs, cut or taken from Dominion Lands, at the place where the same is to be manufactured or sold, and before the same becomes mixed with the timber or saw-logs, the owners or persons in charge thereof shall report the same to the Dominion Timber Agent having jurisdiction in the matter, making, if required, declaration upon oath as to where the said timber was cut, the number of pieces and the description of each kind of wood contained in such raft or parcel of timber and contents thereof in board measure, and should the Dominion Timber Agent not be

satisfied with the correctness of such report, he shall cause a strict count and scale to be made of the timber on such raft; and on being satisfied of the correctness of such report or count, the Dominion Timber Agent may grant a clearance in due form for such raft, when the same may be at the disposal of the owner or person in charge of the same. Should the number of pieces given in the report of the owner or person in charge be found by the specification of measurement to contain a greater number of pieces or contain a greater number of feet in board measure than is given by the owner or agent's report, the surplus number of pieces or overplus, if not satisfactorily explained, shall be held as having been cut on Dominion Lands without authority and subject to payment of dues accordingly. This clause only to have force in case of a licensee making payment of dues on the quantity of lumber contained in the timber or saw-logs by log scale.

MANUFACTURE.

31. All timber taken from berths acquired under the provisions of these regulations shall be manufactured within the Dominion of Canada, and all timber taken from a berth in Manitoba, Saskatchewan, Alberta, or the North West Territories must be manufactured at the sawmill of the licensee to be operated in connection with the berth as prescribed by Section 32 of these regulations unless permission otherwise is given by the Minister of the Interior as provided by the said section.

32. The licensee shall have in operation within one year from the date when he is notified by the proper officer of the Department of the Interior that the Minister of the Interior regards such a step necessary or expedient in the public interest, and keep in operation for at least six months of each year of his holding, a sawmill in connection with his berth, capable of cutting in twenty-four hours one thousand feet board measure for every two and a half square miles of the area licensed, or shall establish such other manufactory of wood goods as the Minister of the Interior accepts as equivalent thereto.

(b.) Provided, however, that notwithstanding anything in these regulations, a licensee may in lieu of erecting a mill be permitted to have the timber cut from the berth or berths held by him manufactured at a mill which is not his own property, provided that he cuts from the said berth or berths at the rate of one hundred thousand feet annually for each square mile held by him under license.

SHIPMENTS OF DAVIDSON LUMBER COMPANY.

New York, Jan. 13, 1908.

CANADA LUMBERMAN AND WOODWORKER,

Toronto, Ont.

Gentlemen,—In order to give you some idea as to the importance of Bridgewater, Nova Scotia, as a shipping port, we just checked over our shipments during the year 1907, and find that we loaded seventy-seven vessels at that port, with a total 32,200 tons register. Vessels in question carried 33,671,136 feet of lumber. This, however, is far below the capacity of said port, as we could ship one hundred million feet if we had the business in hand, and while we fully expected to ship fifty million feet during the past year through Bridgewater, we were unable to do so on account of the demand falling off during the latter part of the season.

The general situation appears more favorable, as we are getting a great many inquiries, and have made some very nice sales, covering large quantities, for shipment by vessel to the export markets. Locally there appears to be some demand, mostly in car load lots, covering spruce and hemlock, and we are quite confident that there will be quite an improvement in the trade in the immediate future.

Our winter shipping port, Lunenburg, N.S., had a new dock built last year; also the channel was dredged out, permitting vessels 28 to 30 Y draft to load there. The dock accommodates four large vessels. Bridgewater channel is also being dredged out. It is expected to finish this during the year. The river is known as La Have river.

Very truly yours,

DAVIDSON LUMBER COMPANY.

The New Brunswick Government have approved of the provincial university's plan for extending its work by the establishment of a chair of forestry.

THE NEWS

The London Lumber Company, London, Ont., have disposed of their business to F. E. Harley.

J. R. Murphy, sash and door manufacturer, Vancouver, B.C., has been succeeded by the Fairview Manufacturing Company.

It is understood that the Nova Scotia Lumber Company are about to commence operations on the Miller property at Economy, N.S.

Robert Hamilton, of the Vancouver machinery concern of that name, is now on a trip to Eastern Canada, in the interests of business.

Therrien & Gareau, lumber dealers, Montreal, Que., have dissolved partnership, and the business will henceforth be conducted by Julien Therrien.

J. R. Booth, of Ottawa, has begun his log hauling from Madawaska, over the G. T. R. to the Chaudiere, where the logs are piled up on the ice. About forty men and teams are engaged in the work.

William Scott, of the Pigeon River Lumber Company, Port Arthur, Ont., has applied to the city for fifty thousand horse-power to use in the operation of large pulp mills which the company will erect.

At St. Thomas, a short time ago, a young Englishman, named William Hall, whilst sawing timbers for W. Esseltine, of Malahide, was struck on the head by a falling tree, and died shortly afterwards.

A Victoria, B.C., despatch contains notice of the incorporation of the Bayard Timber Company, Limited, capitalized at \$250,000, and of the Queen Charlotte Lumber Manufacturing Company, Limited, capitalized at \$150,000.

The new mill of William MacDonald at Langley, B.C., was to be in readiness to commence cutting operations by the first of February. This plant contains a circular saw equipment and has a capacity of about 20,000 feet per day.

Diphtheria has been raging at the McFarlane lumber camp of the Bay Shore Lumber Company, New Brunswick. Dr. McAlister, of Sussex, reports the disease practically under control, although several men were very sick at the time our information was received.

W. E. Simpson, of Iowa Falls, Iowa, and other American associates, organized as the North American Timber Company, have acquired large timber holdings on Vancouver Island and elsewhere on the coast, and will enter upon the construction of a large saw mill this season at Kennedy lake.

The superintending engineer of the Welland Canal, St. Catharines, Ont., will receive tenders up to the 10th inst. for supply and delivery of timber, hardware, castings, etc., for use on the Welland Canal during the coming season. Specifications and further particulars will be supplied on application.

Arrangements are being hurried forward by the British Canadian Wood, Pulp & Paper Company, Limited, of Vancouver, in their project for the erection of a large plant on their property at Howe Sound, B.C. As soon as the pulp mill is completed work will be commenced upon the construction of a paper mill.

Robert Hamilton & Company, of Vancouver, have recently secured an order from the Fraser River Saw Mills, Limited, for sixteen new boilers, each 72 inches by 18 feet, of Goldie & McCulloch manufacture. This order is the largest order for boilers ever taken in British Columbia, and was productive of keen competition.

Amongst the latest concerns to secure a charter are the Dominion Equipment Supply Company, Limited, Winnipeg, Man., capitalized at \$100,000, and incorporated as timber and hardware merchants, and dealers in contractors' supplies. The directors include D. F. Coyle, R. H. Hyland, E. R. Dowdall and J. A. Coyle, all of Winnipeg.

P. Lund, of Wardner, B.C., is building at Marysville, just north of Cranbrook, B.C., a new circular saw mill that will have a capacity of about 40,000 feet per day. It is understood that much of the output of this mill will be railroad ties. The entire machinery equipment has been supplied by the Waterous Engine Works, of Brantford, Ont.

The late W. H. Crow, lumber merchant, of Welland, Ont., left many bequests to charities and public institutions. Amongst the beneficencies are: Methodist Missionary Society of Canada, Presbyterian Church of Canada, Educational Society of Methodist Church, Gravenhurst Consumptive Sanitarium and Toronto Home for Insurables.

F. J. Moore & Son's planing mills, together with valuable machinery and stock, were totally destroyed by fire at Lakefield, Ont., on the 22nd ult. at a loss of \$10,000. The flames originated in the Lakefield Milling Company's flour mill, adjoining, where the damage was \$25,000. Dixon Brothers, of Peterborough, were the owners of the planing mill and they were insured to the amount of \$3,300.

The steamship "Cassiar" brought down to Vancouver a short time ago, the body of a logger named Daniel Smith, who was killed by a falling tree at Valdez Island whilst lying asleep in his bunk. During the night a high windstorm prevailed and a huge pine fell, causing the collapse of Smith's shack underneath. It is understood that the deceased had a sister in Hastings County, Ont.

A lumber glut is reported from British Columbia. The stock of logs in water and lumber on hand is fourteen million feet in excess of the entire lumber output of the coast last year. There are now in stock on the coast two hundred and sixty million feet of logs and lumber. With the exception of two, which are cutting for export trade, all the coast mills are closed down, as are also the mountain mills. Lumbermen declare it will be impossible for them to reduce prices in order to dispose of their stock.

The Falls City Lumber Company, Limited, Niagara Falls, Ont., have been incorporated with a capital of \$40,000. Amongst the incorporators are Alexander Menic, of St. Mary's, Ont., and John Wilson, of Niagara Falls, Ont.

The British Canadian Wood, Pulp & Paper Company, Limited, are preparing plans for the erection of their mammoth plant at Howe Sound, twenty-five miles from Vancouver. Charles B. Pride, of Appleton, Wis., is the architect and engineer.

The Brunette Saw Mills Company, Limited, of Sapperton, B.C., report a very good demand, locally, for lumber, considering the time of year, and they look forward to a good season for the lumber trade. They have made several improvements in their box factory, having enlarged the building and installed new machinery, extensions which have very materially increased the capacity of the plant.

A lumber camp in the district of Fort Frances has been quarantined, owing to the discovery of a case of smallpox by Dr. C. A. Hodgetts, secretary of the Provincial Board of Health. The sick man is a Frenchman who had not been vaccinated. The infection is supposed to have been brought from one of the Northwestern States of the Union. All members of the camp have now been vaccinated.

Representatives of the power, navigation, lumber and municipal interests of the Ottawa Valley recently waited upon the Government for the purpose of urging the construction of a system of dams for the conservation of the upper waters of the Ottawa river, so as to increase the facilities of manufacturing during the low water season and to add a general impetus to trade. The deputation asked for an appropriation of \$160,000, but the whole project involves an ultimate expenditure of about \$500,000. Among the delegates were: R. Booth, W. H. Rowley, W. Y. Soper and Peter Whelen. The Premier promised a thorough investigation of the scheme.

Log pirates have recently been much in evidence at False Creek, B.C., and their depredations have become so serious that the lumbermen will likely petition the Legislature to enact a special measure making it a punishable offence for any person to be found in possession of logs of which he cannot give an accurate account. The practice of the thieves has been to cut the booms by night and permit the logs to escape, only to gather them up for sale later and offer them for about half their value, after, of course, obliterating the branding. Night watchmen are now being employed to guard against such piratical raids. On Puget Sound the operations of the log pirates were some years ago curtailed by just such an enactment as the local millmen and loggers will ask of the Legislature.

A long felt want is about to be supplied to the people of Nicola Valley, B.C., by the completion of the mill of the new Nicola Valley Lumber Company, Limited, at Canford, B.C. This plant will have a capacity of about 500,000 feet per day. The mechanical equipment consists of a log jack, circular saw frame, three-block carriage, four-saw edger, two-saw trimmer, swing cutoff saws, sawdust and refuse conveyors, live rolls, etc., all supplied by the Waterous Engine Company. The power plant consists of an 18 inch by 24 inch Waterous engine and two boilers, 60 inches by 16 feet, of the same make, with steam pressure of 125 pounds. The frame of the mill is up and most of the machinery has been installed. It is expected that the entire plant will be ready to cut during the present month.

Miramichi Lumber Company

Chatham, N. B.

LUMBER
LATHS
SHINGLES

An employe of J. R. Booth at Ottawa, named Pominville, was instantly killed a week or so ago in the Chaudiere timber yard. He was engaged in unloading logs from a car when several timbers came down at once, one large log striking him with sufficient force to fracture his skull and kill him instantly. Pominville was 29 years of age and leaves a widow and family of small children at Mechanicsville.

Geo. A. Walkem & Company, of Vancouver, are building a new warehouse and storage platform on the south shore of False Creek, at the foot of Alder street, Vancouver. The location is an ideal one for the purpose, extending from the C. P. R. track at the rear to tide water. The warehouse is 50 by 100 feet, while the platform adjoining now occupies an area of 100 by 150 feet, but it is capable of extension to a length of 500 feet. The building is frame, wholly covered with corrugated iron. A ten ton derrick, supplied by the American Hoist & Derrick Company, is being set up on the platform. This machine, when complete, will be capable of picking up boilers and other heavyweight machinery, from a car on the track, and transferring same across the platform to a scow floating at the dock, with but the one handling. The company purpose making it part of their business to transfer rails, logging engines and other heavy machinery from railway cars to scows or other floating conveyors, for trans-shipment to points across the water. They will also have a machine shop, with plate working tools, capable of working up to 1-4 inch plate.

The Schaake Machine Works, of New Westminster, report a pleasing revival of business in the machinery line. "During the past two weeks," said Mr. Schaake to the LUMBERMAN recently, "we have had more inquiries regarding new machinery than had come in during the previous two months, and I look forward to a very busy spring. Just at present, however, we are being kept busy on repair work, of which there is considerable on hand, for the different mills. We are also nearing the com-

pletion of a set of marine engines for a new stern-wheel steamer for the Lamb-Watson Lumber Company, Limited, of Arrowhead, which will be used by them on the upper lakes. Another order we are pushing through to completion is the complete mechanical equipment of the plant of the new MacDonald Barnett Lumber Company, Limited, of New Westminster. This order includes six of our latest design Johnston-Schaake shingle machines, a drag saw, knee bolter, power splitter, log haul and bolt haul, and all the transmission machinery."

B. C. LUMBER DEALERS' ANNUAL MEETING.

The annual meeting of the British Columbia Lumber & Shingle Manufacturers, Limited, of Vancouver, B.C., was held in the company's offices in the Crowe & Wilson Chambers on January 15 last.

The principal business done was the election of officers for the company and the different branch committees for the ensuing year. Those elected are as follows: President, John Hendry, Vancouver; 1st vice-president, H. De Pencier, Vancouver; vice-president, E. J. Palmer, Chemaines; and secretary-treasurer, R. H. H. Alexander, Vancouver, all re-elected; directors, E. H. Heaps, Wm. Tytler, J. W. Hackett, G. F. Gibson and F. L. Beecker, all of Vancouver, and L. A. Lewis, of New Westminster. The branch committees are as follows: Lumber branch, E. H. Heaps, E. C. Mahoney, L. A. Lewis, J. E. Tucker, J. S. Emerson and J. W. Hackett; shingle branch, Wm. Tytler, Robt. McNair, Albert Cotton, H. Davidson, T. F. Paterson and P. D. Roe; sash and door branch, J. W. Hackett, E. H. Heaps, E. C. Mahoney, J. A. Sayward, George MacAfee and E. Ulin.

The secretary read a short report showing the financial standing of the company and progress made during the past twelve months.

POSITION WANTED

AS LUMBER SALESMAN; INSPECTOR OR shipper; good connections; A 1 reference from past employers. W. S. ROBERTSON, c/o CANADA LUMBERMAN.

B.C. LUMBER STATISTICS FOR 1907.

Three hundred and seventeen million feet of lumber were sold last year by the coast mills of British Columbia, and 178,000,000 feet by the mountain mills, or an aggregate of 495,065,223 feet for the entire province. This is a heavy falling off from 1906. These figures have been carefully computed by those interested in logging. The figures are not claimed as exact, but as a very near approximate of the sales for the year.

The inland papers state that at the beginning of 1906 there was a stock of lumber on hand amounting to 88,000,000 feet. There was cut during the year 400,000,000 feet, of which 280,000,000 was put through by the fifty mills connected with the Mountain Lumber Association, leaving 120,000,000 feet in the woods and water. The stock on hand at the end of the season was 190,000,000. Thus the sales were but 178,000,000 feet, a decrease from the figures of the previous year. For the year 1908 there is therefore 190,000,000 feet of stock on hand, 1,200,000 feet in the woods and water and about 1,000,000 feet to be logged, giving a total possible output of 410,000,000 feet, more than double the sale of the previous season.

On the coast it has been estimated that 50,000,000 feet have been taken from Dominion lands, which added to the 178,000,000 feet sold in the mountains, makes 228,000,000 feet. The stock on hand in the beginning of the year on the coast was 100,000,000 feet, the actual scale of logs for the year was 407,065,223, or a total of 507,065,223. There are logs in the water, including booms at Harrison, Ninkisk, and other northern rivers, 160,000,000 feet, while there are 80,000,000 feet of lumber in the mill yards. The total unsold is 240,000,000, which subtracted from 507,065,223, cut and on hand, leaves a balance of sold lumber for the coast of 267,065,223 feet. This amount, plus the 50,000,000 feet cut off the Dominion lands, and the 178,000,000 sold in the mountains, makes the grand aggregate of the sale of lumber in British Columbia during 1907 reach 495,065,223 feet.

The Miramichi Lumber Company was not long ago authorized to increase its capitalization from \$400,000 to \$800,000, and the capital has already been increased to \$60,000. The International Paper Company now holds a controlling interest in the company.

JAPAN'S EXPORT LUMBER BUSINESS

Interest in the Japanese lumber trade, particularly in the export business carried on by the operators of that country has been created and maintained by the somewhat exaggerated reports in regard to the resources of the empire, says the "American Lumberman." A report for the last three years showing the value of the wood exports of Japan is given as follows:

Railway sleepers—1905, \$351,000; 1906, \$629,000; 1907, \$1,000,000.

Wood for tea chests—1905, \$131,000; 1906, \$244,000; 1907, \$179,000.

Timbers and planks—1905, \$1,051,000; 1906, \$1,964,000; 1907, \$3,104,000.

Totals—1905, \$1,533,000; 1906, \$2,837,000; 1907, \$4,343,000.

The foregoing shows a very heavy increase, the gain in 1907 over 1905 being nearly 200 per cent. Other exports of woods in 1907 had an aggregate value of \$74,000. Those in touch with lumbering affairs in Japan state that the value of forest products exported in 1908 will reach \$7,500,000. The increase is attributed to the growing demand from South Manchuria, Seoul-Fusan and Seoul-Wiji railways and the construction of dwellings in Manchuria and Korea.

TIMBER LIMIT TRANSACTIONS.

H. P. Potter, of Chicago, was recently in Vancouver negotiating for the purchase of extensive timber limits on behalf of an American syndicate. He stated that he was returning to the east to lay before his firm a proposition involving \$2,000,000.

O. Bowan, the postmaster at Upper Sumas, B.C., has purchased a timber limit from E. Thornton, of Promontory Flats, and will put in a portable mill at an early date.

Three hundred acres of valuable timber have been purchased by the Dominion Iron & Steel Company at East Bay, N.S. The major portion will be used at the company's mammoth works at Marble Mountain.

We are informed that J. & T. Jardine, Limited, of Rexton, N.B., have sold their saw mill and all their lumber interests in Kent County to Frank Curran, of Bathurst. The mill is equipped with all the latest improvements and is one of the finest in the county.

GLASGOW TIMBER SITUATION.

In Edmiston & Mitchell's yearly timber circular, dated Glasgow, December 3, 1907, we are told that "perhaps the best indication of the dull conditions prevailing in this market can be conveyed by the fact that the total consumption of wood goods compared with the previous year shows a shrinkage of roughly one and a half million cubic feet. This has been reflected in the imports, which have been unusually light, prominent examples being Canadian goods of all descriptions. As regards stocks, Canadian timber shows a reduction of about 4,000 loads and of deals and sidings 2,400 standards, while the only important instances of increased stocks are sawn pitch pine and birch plank."

There were several arrivals of small parcels which met with a very indifferent reception, owing to the fact that they were largely of inferior quality. The few lots of good white ash made a fairly ready sale, although the demand in this market nowadays is really insignificant.

Of Quebec birch the import for the year was 1,231 loads, as against 2,984 loads for last year, but, with the heavy stock carried over from 1906, has proved more than ample to meet the market's requirements.

As was to be expected, the total import of Quebec deals falls considerably short of that for the previous year, being some 5,200 standards less, while there is a decrease in consumption of nearly 3,000 standards. Stocks as a whole are of quite a healthy nature and show a substantial all-round reduction from last year. Current values are as follows:

Broad first pine deals, £34 to £35; 11 inch, £33 to £34; ends and none-dimensions, £25 to £26.

Second pine deals, 11 inch and up, £23 to £24; ends and non-dimensions, £16 to £18.

Third pine deals, 11 inch and up, £15 to £16; ends and non-dimensions, £11 10s. to £13.

Red pine deals, 9 and 11 inch, £10 to £11; narrows, £8 to £9.

First pine sidings and strips, 9 to 10 inch, £23 to £24; 11 to 12 inch, £25 to £26; 13 to 14 inch, £28 to £29.

Spruce deals, 9 inch and up, £9 to £9 10s.; 7 and 8 inch, £8 to £8 5s.

According to a statement made by Hon. Chas. E. Oak, of the International Paper Company, that firm's output on the Richards and Hutchinson properties on the Miramichi for last year would probably amount to 40,000,000 feet. Practically the entire output will be used for pulpwood and will be shipped by vessels from Chatham to the United States.

Current Trade Conditions

ONTARIO.

The snowfall of the past week has been welcomed by lumbermen in Northern Ontario, since thus far this winter they have been handicapped owing to lack of hard weather. Iced roads have been almost unobtainable and bush operations have in consequence been seriously retarded. No alarm, however, is felt regarding this, as it is pretty generally agreed that the smaller stocks are allowed to become the more sudden and complete will be the revival of trade at the expiration of the present business lethargy.

Trade appears to be opening up again cautiously. Inquiries and orders are coming in slowly and encouragement is held out of much greater results being in evidence in a few weeks' time.

In the meantime prices show no signs of fluctuation either way. Middlemen claim in some instances that they are buying to better advantage now than for some time past, but in view of the expense at which this season's cut is being taken out there is not the slightest possibility of prices falling. Buying will be late and millmen may have to carry larger stocks than in former years, but beyond this the situation presents no alarming features.

EASTERN CANADA.

English timber circulars for January note that the arrivals of Nova Scotia and New Brunswick spruce deals at both Liverpool and Manchester have been small. There is comparatively little lumber business being transacted. However, if the operators are able to tide over and live through the present financial depression the industry will

next spring be in its usual healthy condition. Inquiries are beginning to come in slowly, both from the American and European markets. Everyone is cautious and no one is buying. A few mills are cutting, but have not been able to place orders ahead as is usually the case.

WESTERN CANADA.

Rumors from Western Canada indicate that the outlook for the lumbering industry is rather cloudy just at present. A Vancouver report states that the stock of logs in water and lumber on hand is greatly in excess of the normal, and that a determined stand must be made to maintain prices at any hazard. The coast mills are not in such a serious condition because their stocks of lumber and logs are much nearer normal than are those of the interior mills. The latter are bringing every influence to bear to prevent any reduction in the price of lumber, and it looks as if the stand were unanimous.

In a few weeks it is conceded that the outlook for building will brighten and lumber commence to move again.

UNITED STATES.

Some orders for white pine are coming in from factories that have resumed operations, but no large orders are being booked and prices are inclined to drag. The hemlock market is equally dull, although a hopeful feeling prevails that better trade is in prospect. Spruce supplies in New York are said to be rather low, and signs of activity are appearing. Buffalo reports state that enough lumber of that variety is on hand to make a fairly full stock, considerable quantities

having come from Canada.

No improvement in hardwoods has been noticeable, and very few orders are being received. Furniture factories are buying little.

GREAT BRITAIN.

The market for Canadian spruce is fairly strong, and with careful and judicious shipping on the part of the New Brunswick and Nova Scotia trade will remain so, thinks "The Timber Trades Journal." Stocks are going down slowly but are still ample for some time to come. Scantlings are somewhat scarce and boards decidedly so.

Birch planks are firm with a tendency to stiffen, as stocks are gradually being reduced. The average quality of the stocks is said to be not too good, which may perhaps account for the fact that they have not advanced further in price.

There is no change in the position of Quebec deals in the Liverpool market. Stocks of the low grade deals are small and command good prices. Second quality are scarce. The demand for red pine is very limited.

B.C. TIMBER TRANSFER.

From a New Westminster, B.C., report, we learn that W. N. Norton, a wealthy timber man of Medford, Wis., has purchased 2,500 acres of timber lands from J. J. Jones. The limits are situated near Indian river, and are said to be the finest in the Vancouver district. An exhaustive survey is now being made by Mr. Norton to decide which would be the more advisable, to build a mill at Indian river or to take the logs down to Vancouver for cutting.

EASTERN TRADE UNUSUALLY QUIET

St. John, N.B., Jan. 24, 1908.—Since last writing there has been little change of importance in the market end of the lumber industry.

Trade in this direction is remarkably quiet even for this season of the year. Shipments by the winter liners, which, during January, are usually fairly heavy, have been far below the average so far during the present month. This is due to the fact that the heavy quantities of grain being shipped through this port leave little room for lumber, so that the shipments of the latter line would not reach a total that could be called at all important.

The most interesting phase of the situation so far as local people are concerned is the continued absence of any important fall of snow. The prospects for a successful manufacturing season during 1908 are daily growing slimmer. Throughout the southerly portion of the province, as far north as Fredericton, there is no snow whatever. In the district described there is little being done in the way of getting out logs. Logging crews are coming out in great numbers. Portable mills are also suffering for lack of snow and many have been compelled to cease operations entirely.

In the more northerly sections, different conditions prevail in different localities. On the Tobique River (a branch of the St. John), report tells of eighteen inches of snow and fairly good logging conditions, while on some of the other branches the loggers say that they

are suffering because of the lack of snow. Unless there comes a good fall, and that quickly, the log crop for the season on the St. John River will be necessarily curtailed and to a greater extent than was previously planned.

The high prices for cedar shingles continue to be the feature of the trade. Shingles are scarce in this direction, and most of those at the local wharves and yards have been disposed of for shipment in the spring. Of those that are left 1,800,000 of "Extras" and 1,200,000 of "Cedars" would be the proper figures. The figures upon which recent transactions were based range from \$3.10 to \$3.25 per thousand on dutiable "Extras" and from \$2.60 to \$2.70 per thousand on dutiable clears.

During the latter part of December the situation as regards spruce deals for export to Great Britain promised to show some signs of life. So far these promises have born little fruit, having shown little in the way of tangible results. Ideas in this regard are of a somewhat contradictory nature. So far as can be learned little is being done in the way of buying ahead for delivery during the summer season. It is a foregone conclusion that one who wished to sell at present must name very attractive figures; dealers and shipping houses will no doubt act with caution in making contracts. Of course, local manufacturers are in a position to be quite independent, owing to the conditions mentioned in earlier contributions, which have to do with the usual shortness of the coming sawing season at local mills, the greater number of which will not begin operations until late in May. Anything in the way of quoting prices would be merely a guess, transactions are so few and so small that to name an applicable figure would be difficult.

LUMBERING IN RAINY RIVER DISTRICT.

La Valle, Ont., Jan. 26, 1908.—

In past winters lumbermen in the Rainy River district in Northern Ontario have chiefly confined their operations to handling logs. This winter, owing to a dull market and uncertainty as to the extent of next season's operations, fewer logs will be taken from timber berths. Although just now labor is cheaper, there are other difficulties to be considered, such as lack of snow and frost for making good iced roads. Then too the output of some camps must be hauled over lakes and rivers, where ice is as yet too thin to carry a load of logs. First-class lumberjacks too are scarce, although the inexperienced and incompetent are only too common.

Increasing attention is being paid to the smaller and poorer kinds of logs. At one time pine only—and choice pine at that—was wanted. Then spruce and tamarac became desirable, while to-day balsam, poplar and balm, sometimes scattering and expensive to log, are sent to the mills. Another feature is the ever-increasing distance some of the logs travel, by water or by rail, to reach the mills.

The new government arrangement by which limits are estimated before their sale, has been a source of satisfaction to operators, as is also the new method of selling according to estimate instead of taking a settler's record of stuff cut which gives only a part of the amount.

A feature of lumber manufacturing in Northern Ontario now is the increased cost of almost all requisites. Wages are high; food must be of better quality; the mill plant must be more up-to-date and expensive, while to all this must be added the greater cost of sawing, grading and piling the lumber.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

Johnson's Horse Liniment No. 1.
A penetrating Alcoholic Liniment. Put up in one gallon jugs, with full directions, per imperial gal. \$4.50

Johnson's Horse Liniment No. 2.
A combination of the best oils used as liniments, imp. gallon . \$3.00

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic. Imperial gallon \$5.00

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . . \$2.25
or in 1/4 lb tins, per dozen . . \$3.50

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb 30c.

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating liniment, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to \$100.

Send postal for printed matter.

CANADIAN TIMBER SUPPLIES.

Canada is one of the very few countries which can be depended on to produce more timber than is sufficient for its needs. Such is the opinion of a great French authority, M. Melard, who has made a careful study of the source of the world's timber supply. There are only seven countries in the world which now export wood in any quantity. Besides Canada, these are the United States, on this continent, and, in Europe, Austria-Hungary, Norway, Sweden, Russia and Finland. In Asia, only Russia has more than enough for her own use; Africa and South America can send little or no timber suitable for ordinary use, and Australia can supply little.

Of the seven exporting countries mentioned, the United States, Russian and Austria-Hungary have been increasing in population and developing their resources so rapidly that they must soon cease to rank among exporting countries. Norway is overcutting her forests and must soon decrease her export. Only three countries remain, namely, Canada,

Sweden and Finland, as sources that can be depended on for the timber supply.

Canada's forest area has been estimated at 800,000,000 acres, but so much of this is of little value naturally, or has been burned over, that more recent estimates fall much below this, even less than half. The amount of wood produced annually is no doubt much in excess of what is now being cut each year. It is important, however, if Canada is to hold her position as a timber producing country, that her forests be protected from fire and so managed as to ensure the greatest amount of timber being cut year after year, so as to keep them producing in perpetuity; and it is to this end that efforts are being made to secure better care of her forests.

WHOLESALE LUMBER DEALERS' ANNUAL MEETING.

At a recent meeting of the National Wholesale Lumber Dealers' Association of the United States it was decided to hold the next annual convention at Washington, D.C., March 4 and 5 next.

WHOLESALE DEALERS IN

1908 ?

YES, we are optimists and have the utmost confidence in 1908. We have increased our facilities for supplying "QUALITY" SPRUCE of superior grade and the finest possible mill work. We are now in position to take care of either straight car business for FLOORING, CEILING, PARTITION, NOVELTY SIDING, NEW BRUNSWICK CEDAR SHINGLES, LATH, etc., or thoroughly mixed cars of the above. Our facilities for this business are unequaled anywhere. If you wish small quantities of various varieties we can serve you as well as on straight car shipments.

We have built up our trade to its present large volume through uniformly fair treatment of customers and close attention to the quality of our products. We believe that "Quality is the best policy." Our customers believe it also. It means to them satisfied trade, larger profits, increased business, and the satisfaction of always handling the best of its kind. The time when any old thing would do has passed. Now people want things right. They feel with us that "Quality is the best policy." If you do not know the meaning of "FENDERSON QUALITY" you will do yourself a favor by trying "Quality Policy" and Stock.

TO MILL MEN SOMETHING NEW

You will find that by using

FREEZE'S PATENT BELT LACING TOOLS

you will save more than half the time usually lost in lacing belts. Consider—

How much do you lose every year by reason of machinery standing idle while belts are being laced.

You can stop over half of that loss by using the above named tools for running leather laces into belts. They will be sent to any address in Canada by mail on receipt of price with order, and with ordinary care they will last a life-time.

Price 50 Cents Each.

The

McGIFFERT

LOG LOADER

works just as well in wet, swampy country as on dry ground. Fact is it's the only loader that's independent of weather conditions—wet or dry, on level or a grade, cuts, hills, side hills, level or mountainous country, it's all the same. That's why so many are in constant use. They work well anywhere.

Say! Where shall we send a copy of our new catalogue? It's a beauty.

MONTREAL
TORONTO

R. H. SMITH CO. Limited

— St. Catharines, Ont. —

We are the Sole Manufacturers of Saws under the **Simond's Process** in the Dominion of Canada

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. All such Claims are FALSE, as the patentee in the U. S. and ourselves are the only firms in the world who use it.

INSERTED TOOTH SAWS

Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS

THE "NARROW LEADER"
REFINED SILVER STEEL.

The Simonds Temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

Write for prices.

COBBS HIGH PRESSURE SPIRAL PISTON AND VALVE ROD PACKING

"Cobb's" Packing is especially adapted to withstand heat and highest pressure. The rubber core is oil and heat-proof and will not harden, but remain elastic indefinitely. The outside covering is made of material that is not affected by heat. The lubricant employed is the result of much scientific research and is absolutely free from grit or acids.

We make everything in rubber requisite for an engine room. The following are some of our specialties:

VULCAN SPIRAL PACKING, MAGIC EXPANSION SPIRAL PACKING, AMAZON HYDRAULIC SPIRAL PACKING, INDESTRUCTIBLE (WHITE), KARBONITE (BLACK) RUBY (RED), AND SALAMANDA SHEET PACKINGS, RUBY SECTIONAL CASKETS, GAUGE GLASS RINGS, DISCS, BIBB WASHERS, PUMP VALVES DIAPHRAGMS, PACKING RINGS, RUBBER BELTS, &C.

A Cracker-Jack Good Thing

for you to do right now, Mr. Mill-
man, would be to write us regarding

The Columbia Shingle Machine

while you're now overhauling your mill for next season's run.
We've some interesting facts to put before you.

The Columbia saves time—saves timber—saves labor. From morning till night it will pound out more and better shingles from a given amount of stock than any similar machine made. Its spalling attachment enables all boards and slabs to be converted into shingles at a good profit. But write us about it.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other
foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOOD-WORKER is published in the interest of and reaches regularly persons engaged in the lumber, wood-working and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN AND WOOD-WORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — FEBRUARY 15, 1908 — MONTREAL

THE SUPPLY OF LUMBER.

Considering the long period of comparative inactivity which they have been called upon to endure for so many weeks now, it must be confessed that the lumber manufacturers and dealers have the lumber situation well in hand in this country. The story of the coming building season will be written largely by them, and it seems safe to assume that they will see that it is a season of sane expenditure. That it was a bankers' and not a general agricultural and industrial panic that has alarmed us of late must be conceded, but when the banks refused to extend their credit and called in their loans and money was locked up in vaults and socks, those businesses already on the verge of collapse paid the penalty for unstableness, while others, truly alarmed, stopped and took account of their belongings. In this class was the lumbering industry.

While no panic exists, or has existed, the business of the country will take some time yet to recover. It is claimed that at present the banks have more actual cash on hand than they have had at any one time for years past, while their hoarded currency is only beginning to come out cautiously in search of quarterly and annual dividends. By summer it is thought that cheap money will be again abundantly available.

The lumbering industry is peculiarly one which, on account of its magnitude, requires large borrowed capital. That capital has been greatly reduced for months past, yet the trade has gone cheerfully along, confident in its stability and power to ultimately win out. That hope is now being verified. The cheering information of mills starting up again, and of a re-awakening retail demand, are indicative of the strength that lies behind the industry. Each week is showing an improvement in the call for lumber, while just as surely is there also evidence given of a decrease in the available supply. Conditions in the bush in almost all parts of Canada have been far from favorable for cutting, and the supply of material that will next summer be available promises to be unusually small.

This is a matter for congratulation. The buyers and consumers of lumber—with some exceptions, of course—do not want the market broken or even unsettled. Those buyers not in the market now are not particularly interested in prices, and it has been no use trying to sell them anything. It has been a good thing, this combination of fortunate circumstances which has been the means of keeping the market stable, and if demand has been slow in reviving it must not be construed as auguring ill for the future welfare of the industry.

A PECULIAR LOGGING YEAR.

The snow of the past fortnight will doubtless be more welcome in the woods where lumbering operations are going forward than in the more settled portions where traffic and business has been suspended. Up to the present it would appear that the lumbermen need not have come to the conclusion that it would be wise to cut less lumber this winter. The weather man had apparently assumed the responsibility, and is only now permitting operators in the bush a free hand. But the season is already wearing old, and February in former years has not brought the first real winter's snow. As it is, complaints of inability to swing earlier into bush operations have not been particularly noticeable this winter. Had the lumber market been in better shape, prices high and the demand good, and at the same time nature been warring against a cut of sufficient size to supply the country's needs, there would doubtless have been a hue and cry long ere this. But, as it is, nature and the market have evidently conspired to care for the industry and everything appears sound.

Of course there is but poor comfort in these reflections for the lumberman, but it is not a difficult feat of memory to recall the slump of a few years ago, and the effect it had on many pioneers of the lumbering industry. Moreover, what would have been the effect if we had had such unfavorable logging weather in past years when the demand for lumber was strong? Things are certainly not so bad that they couldn't be a little worse. If we are to have a curtailed demand for lumber it is well to have a poor lumbering year to make the fact more digestible. If the usual number of men had been able to get into the woods and cut logs this winter there would simply have been a further and more marked prolongation of the depression. As it is the period of greatly curtailed production will have a tendency to more speedily bring the market back to normal conditions and assist in strengthening it in the near future.

THE GEORGIAN BAY CANAL PROJECT.

The suggested building of the Georgian Bay Canal has been discussed in the press and by politicians pretty generally of late, and the result of the Government's surveys and estimates of cost have been illuminating.

From the standpoint of traffic from west to east, particularly of the movement of the grain, the project is of vast importance and furnishes a solution of a problem which year by year becomes more pressing. The Georgian Bay Canal should mean cheaper freight rates and better delivery of the products of western markets to foreign ports. But over and above that greater result the completion of such a canal would tap a territory in Northern Ontario in which the lumberman holds sway and afford him better facilities for marketing his product.

Particularly would this be the case if legislation should presently go into effect, as seems likely, limiting or prohibiting the export of pulpwood to the United States. More and more pulp and paper manufacturing would become one of the leading industries of Northern Ontario, and the European market for the product would speedily assume considerable proportions, for the export of which the Georgian Bay Canal would be almost an essential.

Between Ontario and Eastern Canada also a connection would be established by this canal which would serve as a medium of exchange for the natural products of these two widely separated territories. It is desirable that as much Canadian trade as possible should be handled in Canadian territory. At present too much of it is seeking American transportation facilities, oftentimes to arrive eventually at a European market.

From the standpoint of the maritime provinces the Georgian Bay Canal project has much to recommend it. It is claimed on rather problematical grounds, however, that a market would be afforded eastern coal as far west as Fort William. It seems more reasonable to assume, however, that eastern spruce and hemlock would find its way into Ontario with a readiness that the growing demand of the past summer for this material has presaged. To the lumbering industry of Canada the Georgian Bay Canal project is going to be of untold value.

CANADA'S FOREST AREA.

Three hundred million acres is the latest estimate of the forest area of Canada. This was given recently by Dr. B. E. Fernow, Dean of the Faculty of Forestry, in the University of Toronto. Dr. Fernow was for years engaged in forestry work in the United States, and is regarded as one of the best authorities on forestry and timber on this continent. Dr. Fernow said: "If we look at this vast forest area from the manufacturer's point of view, from the standpoint of supplies for the arts and industries, of its commercial value, and study merely the geography and nature of the country in the light of the reports on the more or less outlying parts of the same, we will come to the conclusion that three hundred million acres, and perhaps less, will cover fully the commercially valuable timberland area, actual and potential, or not much more than one-half of the commercial forest area of the United States."

At one time eight hundred million acres was the generally accepted estimate of the timber land of Canada. Mr. R. H. Campbell, superintendent of Forestry for the Dominion Government, was not quite so pessimistic in a recent estimate. Speaking at a forestry convention held in Yarmouth, N.S., he calculated the forest area of the Dominion at about 535,000,000 acres, divided as follows:—

	Acres
British Columbia	182 million
Manitoba, Saskatchewan and Alberta, and unorganized territories	180 million
Ontario	40 million
Quebec	120 million
New Brunswick	7½ million
Nova Scotia	5 million

Look at it as we may, one thing seems clear, and that is that, on further knowledge, Canada's "inexhaustible" forests and forest areas are shrinking, and that this country does not possess the wealth that it was once thought that she did.

RAILWAY ACCIDENTS DUE TO DEFECTIVE TIES.

A lumberman, who has given this matter some attention, makes the suggestion that bad ties are responsible for many of the recent railway wrecks. Five years ago first class ties could be bought for twenty cents apiece; to-day the same ties would cost sixty cents apiece, while they are scarce even at that price. Five years ago railways demanded ties six inches thick with at least six inches face on the flat surface. To-day they still demand ties six inches thick, but many roads have reduced requirements so that a tie showing a three inch face will pass. This means that a much smaller piece of timber will suffice for a tie than was permissible five years ago. While ties have thus been growing smaller, rails and rolling stock have been growing very much heavier. The great increase in the price of ties, and their absolute scarcity at any price, has caused railways to lengthen the life of a tie as much as possible, and the lumberman quoted thinks that some of the many recent wrecks have been caused by the spikes being pulled from these poor ties by the swing of the heavy locomotives of to-day. Even where the disaster is laid to a broken rail it is impossible to say whether the rail broke before or after the spikes gave way. The railways are pursuing several different lines of effort to overcome this difficulty. In the first place they are working to perfect the steel tie. The tie itself is fairly successful except in the point of fastening it to the rail. Again railways are acquiring land and planting trees suitable for ties. The latest attempt is to find a cement tie to which the rail can be fastened. All this anxiety, this increased cost, and this searching for substitutes shows how acute the timber famine has really become.

SETTLERS GET PINE LUMBER.

By a measure introduced into the Ontario Legislature on the 11th inst. by Hon. Frank Cochrane, Minister of Lands, Forests and Mines, a change will be made in the Act respecting free grants to settlers on public lands. By it the Minister of Lands may open for settlement territory not valuable for its minerals or pine timber, but suitable for agricultural purposes. It cites that "all the pine trees, mines or minerals on

such lands shall be included in any location or sale under the Act, and the patent for such lands, when issued, shall include the pine trees, mines and minerals." The locatee will not, however, be entitled to dispose of pine, except for building or fencing, or in the course of clearing the land, until he has been six months in residence and has erected a house, and sown crops on six acres of the land. The grant of the timber will, of course, not be applicable to property under timber licenses, but the Act can be made operative as regards grants already made. Another of Mr. Cochrane's measures brings a similar provision into force in the district of Rainy River.

Timber on the forest reserves which has been damaged by fire, or has reached a mature growth, may, under the amendment, be sold by public tender.

GRAFT IN WESTERN TIMBERLANDS.

Much political gas is at present being generated at Ottawa with regard to alleged dishonest leasing of timberlands in Western Canada to political adherents of the Laurier Government. At the instigation of Mr. A. B. Ames, member for St. Antoine, Que., an investigation has been commenced which promises to prove most interesting to those least interested. The "plot" discovered by Mr. Ames is briefly as follows:

In the fall of 1903 the Department of the Interior advertised for tenders for a western timber berth of about seventy square miles area. Three tenders were received. One was put in by Mr. C. W. Fraser, K.C., of Ottawa, for \$1,000; a second was for \$6,420, put in by James Curry of the Saskatchewan Lumber Company, and a third tender, in the name of W. H. Nolan of Montreal, was submitted, offering \$7,000, or \$680 more than Mr. Curry's offer. The timber berth was awarded to the highest tenderer, who afterwards transferred the lease to the Imperial Pulp Company, of which Sir Daniel McMillan, Lieutenant-Governor of Manitoba, is president. Mr. Ames, as soon as he saw the original papers, at once pounced on the fact that the handwriting on the first and third tenders was the same, and that Mr. Nolan's signature on the transfer of the lease to Sir Daniel McMillan was different from the signature attached to the tender for \$7,000.

The affair looked suspicious. Mr. Ames insisted on the original documents being brought down in the House. At first Sir Wilfrid Laurier objected, but finally consented to an investigation, which is now in progress.

GATHERING LUMBER STATISTICS.

The Forest Service of the United States Department of Agriculture have commenced the work of collecting lumber statistics for 1907. Cards are being sent out to all the millmen of the country asking for the information necessary to make the report complete. They contain blank spaces for figures on the various kinds of lumber produced in the United States, and the average value of the products at the mill. On the reverse side are a number of questions designed to bring out other valuable information. The idea is a commendable one and might well be adopted by the Dominion Government, with a view to giving lumbermen and others information on the character and extent of one of this country's greatest industries.

DOES GREEN SPRUCE MAKE GOOD FLOORING.

The following question, submitted by a large and well-known lumber manufacturer, seems to us of more than passing importance, and we submit it to our readers in the hope that opinions will be freely expressed upon the matter for the benefit of the trade in general:

"Have you any information regarding the making of spruce lumber, green from the saw, into flooring and siding, novelty siding and clap-boards? Does it give satisfactory results?"

B.C. SHINGLE PRICES TAKE A DROP.

British Columbia cedar shingles have dropped 25 cents a thousand. Rates at the coast are now as follows: XXXX, \$2.55; XXX, \$2.40, and XX, \$1.55, f.o.b., Vancouver.

A Review—Past and Future

The winter season of 1906-07 in the woods was marked by unusual activity throughout Ontario and the Eastern Provinces. Weather conditions were favorable and the cut showed a decided increase over that of the previous year. The heavy snowfall hampered operations in Northern Quebec and the Northwest Provinces, and the number of railroad ties cut in the latter was less than the demand. In Nova Scotia, however, the contrary condition prevailed, while there labor was also scarce.

The spring of 1907 was backward, but the high water in the streams permitted exceptionally rapid progress to be made with the drives. Men were scarce for this employment and wages high. The season in the mill was favorable, the time lost in May being amply made up in the fall. Preparations made during the autumn months of 1907 for this winter's cut were on a much less extensive scale than in 1906, the high price of supplies, the falling off in demand in both home and foreign markets and, above all, the difficulty in financing operations being the causes of a curtailment in the cut.

The history of the general lumber trade during 1907 cannot be written in a single chapter of unbroken demand and unvarying prices as was the case in 1906. The early months of the year opened with a good call for lumber at firm prices and everything augured well for a twelvemonth of unprecedented prosperity. Building activity was early afoot, and only the inclement and tardy spring prevented a rush into costly structural undertakings. As it was, May had arrived before the weather permitted steady outdoor work. Throughout the summer months the cost of new buildings in Toronto and most of the large cities of Eastern Canada was unprecedentedly large. Toward fall, however, this activity suddenly ceased. "Tight money" became the primary topic of conversation, and a flurry or two in Wall street caused a sudden retrenchment of anything but the most ordinary and necessary undertakings. Lumber prices, however, were pretty thoroughly maintained during the entire season, despite the slackened demand, present list prices for all classes of material being practically what they were during the period of heaviest demand last summer.

Sawing operations in the Ottawa and St. John valleys came to an end for the year with the closing down of the larger mills at the beginning of December. Between 2,000 and 3,000 men were thereby released and as the gangs required for the camps were about 20 per cent. smaller than in the preceding year, many of these found it necessary to look for work elsewhere. All along the railway lines from Hull to Sault Ste. Marie is to be found a continuous line of saw mills and camps, where staffs were reduced from 40 to 50 per cent. The decrease in wages also was as much as 25 per cent. from those prevailing last year. Engagements have been made below Quebec and men brought up for the Eddy shanties on the Rouge river at \$20 and \$26 per month, a decrease of as much as \$10 from the prices of last fall.

The industry in Manitoba was interfered with greatly by the backward state of the crops all season, and the financial uncertainty. During the year 1907 the amount of building, both in towns and rural districts, did not reach the volume anticipated, while the action of the banks in not increasing and extending lines of credit also made collections bad. The result is that lumber stocks are heavier than usual and a pronounced curtailment has been made in the cut throughout the prairie provinces.

In British Columbia the season opened with a shortage of cars and bad transportation generally. The demand for western lumber and shingles was at no time during the summer extraordinarily large, and toward fall it became apparent that dull times for the lumbermen were in prospect. Prices were unsteady and a general reduction in output was decided upon, which appears to have since been pretty generally adhered to.

Regarding prospects for the coming season, the general opinion is one of optimism. No attempt is made to conceal the fact that an improvement on the demand of the past few months is desirable, but at the same time there is no mistaking the feeling of confidence with which the future

is being anticipated. In reply to inquiries sent out by the LUMBERMAN a few of the replies as to the business outlook have been as follows:

ONTARIO.

"Prices should be better."

"Trade probably about same as 1907, with higher prices ruling in the fall."

"There is very little lumber in the millmen's hands. Culls are sold up closely, and I believe prices will be maintained."

"We don't look for lower prices. A lower demand seems probable."

"Everybody with whom we have come in contact seems to maintain a good feeling and is looking for a rapid return of the demand for lumber. All of the cypress mills in Louisiana have shut down and nearly every hardwood mill in the States has done likewise, and when business does begin to start up, it is going to be a conundrum where the supply of lumber will come from, as we firmly believe that business will go off again all at a jump."

"Presidential year in United States is always unsettled. The anticipated shortage in production will likely tend to make values firm and prevent a slump. Buying will be later and millmen will have to carry stocks larger than in recent years."

"Expect market will be all right by spring. Prices for 1908 should be those prevailing in early part of 1907."

"With a notable reduction of from 40 to 50 per cent. in the output of logs this winter, the increase in demand for pulpwood and the increase of use for all woods occasioned by increase in population on this continent, it seems inevitable that the future of the timbered areas and of results to proprietors must be assured."

"Think matters will brighten up generally soon, at least to some extent, but fear that the 'good' times will have to be waited for until after the Presidential election, owing to money shortage caused by trusts."

"Expect better conditions than during last quarter of 1907. Think old prices will rule."

"Think trade likely to want the snap it has had, but do not think quantities in stock to be excessive for a nominal demand."

EASTERN CANADA.

"We feel that the lumber and money market will open up fairly well a little later, but things are slow just now. We have made a few sales for 1908 stock already and hope for the better later."

"The logging in this province is curtailed to about half the general quantity for this winter and this, we think, should make a scarcity of lumber for this season. We look for a good demand and fair prices this coming summer and fall."

"The large wholesale operators have not got their usual bank accommodation this year and have not paid up as in past years for wintering stocks. This, however, promises to right itself within a month."

"Stocks in the English market, which is our market, are large, and until these are somewhat ordered we cannot look for much improvement. Owing to unfavorable weather conditions, high prices of supplies, high labor and tight money market, the output of this district the present season will not, we think, exceed half last year's production. This will have some effect in assisting conditions to right themselves."

"The entire situation in Canada is hopeful. The only weak spot in the American market, to which, during the past few years, a large quantity of spruce, pine and hemlock, also lath, has been shipped. Weather conditions have been thus far bad. Operators will not put out more than 50 per cent. of the quantity cut in 1907. After the middle of the season we anticipate a good demand at satisfactory prices."

WESTERN CANADA.

"Building has fallen very flat in this part of the country and will doubtless be slow for a year, although we feel confident that trade will improve from this time out for several years."

"In our opinion stocks are fairly heavy, with the purchasing power of both retail dealers, farmers and builders of all kinds greatly reduced."

"Do not look for a great volume of business for a few months at any rate."

"Careful action will be the policy of the retailers. Not much building will be done, except in certain prairie sections where crops were good. Upon the whole, we anticipate a quiet year in the trade."

OBITUARY.

GORDON BURLEIGH PATTEE.

By the death of Mr. Gordon Burleigh Pattee, which occurred in Ottawa on the 7th inst., that city has lost one of its pioneer lumbermen. Deceased was born near Lebanon, New Hampshire, in January, 1823. His father was an American and his mother of English birth. Mr. Pattee was engaged during practically his whole business life, as a manufacturer and dealer in timber and lumber. In partnership with the late Mr. W. G. Perley, he carried on a lumber business for some years, near West Canaan, N.H. In the year 1855 Messrs. Perley & Pattee came to Ottawa, acquired some timber limits and built large mills at the Chaudiere, on the site now occupied by Mr. J. R. Booth's saw mill, where they carried on business successfully for many years and won the esteem of the business men and citizens of Ottawa generally. Later on Mr. G. H. Perley and Mr. C. Berkeley Powell became members of the firm of Perley & Pattee, and the actual managers of it. A few years after the death of Mr. Perley, senior (which occurred in 1890). Mr. Pattee gave up active business and devoted himself to investing and looking after the large property which he had accumulated by his long years of active work and strict attention to business.

For many years Mr. Pattee was vice-president of the Reform Association of Ottawa and took a deep interest in political matters. On several occasions he was offered nomination for Parliament, but never could be induced to accept, even when his taking the field practically meant his election. He served, however, for two years in the Ottawa council as alderman for Victoria ward, and took a deep interest in all charitable work. He was one of the original promoters of the Upper Ottawa Improvement Company, the Standard Electric Company, and several other local business incorporations and was recognized as one of the shrewdest business men in Canada. Mr. Pattee was always popular with his working men, to whom he showed kindness and consideration and with all his acquaintances because of his uniform geniality and good humor.

A widow and four children survive. Of the latter the two daughters, Mrs. C. Berkeley Powell and Mrs. Fred. W. Carling, live in Ottawa, and the two sons, Henry and Lewis, in Riverside, California.

NELSON VAN EVERY.

Nelson Van Every, for the past 25 years foreman of Bowman & Company's planing mills, at Dundas, Ont., died at his home in that town last week. Deceased was in his 62nd year and was a well known citizen with a host of friends who will regret his demise. He was born in West Flamboro, at the old Van Every homestead, being a son of the late Hugh Van Every, one of the earliest of the U. E. Loyalist stock, who came over from New York State. The surviving brothers of the deceased are Glark, in Waterloo; Warren, of Toronto, a well known railway man, and three sisters, Mrs. Rusby, of Burlington; Mrs. Gilbert, of Hamilton, and Mrs. Youngston, of Victoria Harbor. He is survived by a widow and six daughters: Mrs. John Anderson, of Philadelphia; Mrs. George W. Rushton, of Cornwall; Mrs. Frank Tapp, of Cleveland; Mrs. Fred Wild, Mrs. John Spearing, and Miss Alta, at home, and two sons, Elihu and Ronald.

The late Mr. Van Every was a strong Conservative, and a prominent worker. He was a member of the C. O. O. F. and A. O. U. W. and was recorder of the later society for over twelve years.

It is with deep regret that we announce the death, on December 26, last, at Stockton-on-Tees, England, of Mr. A. E. Jessop, of Revelstoke, B.C.

A. E. JESSOP.

Mr. Jessop has been for the past six years connected with the lumbering business in interior British Columbia, and for three years was secretary-treasurer of the Revelstoke Sawmills Company, Limited, but resigned in July last, owing to ill health. In the hope of bettering his health, Mr. Jessop left, with his wife, on December 5, for a six months' trip to England, but the voyage appears to have been too much for him. Mr. Jessop was a prominent Mason, and was well known to the lumbering fraternity of British Columbia.

SIXTY MILES OF LOGS.

The largest raft of logs ever towed out of Nova Scotia to Boston, recently arrived at the wharves of the New England Gas & Coke Company in Everett, Mass. It measured nearly 400 feet in length, 50 feet in width and 28 feet in depth. It contains over 7,000 logs which, if placed end to end, would stretch over 60 miles, the distance from Portsmouth to Boston. The raft floated with 10 feet of logs above water and 18 feet submerged.

Port Greville, where the raft was built, is at the head of the Bay of Fundy. It being the first attempt to raft such a vast number of logs so long a distance, the greatest precaution had to be taken to insure their holding together.

The raft was made up in 10 sections, averaging about 40 feet in length, each independent of the other, but all welded into a unit by a heavy iron chain running through the centre of the raft from bow to stern. Each section is fastened by wire binding cables running across the logs from stanchions placed at each side. In addition wire cables extend from maple girder ties placed on the top of the raft down through the logs, under the bottom layer and are brought up and made fast to the stanchions well above the water line. The inboard ends of the cables are fastened to tension devices on the girders so that whenever the cables loosen they can be brought up taut. Thus each section is doubly bound, horizontally and vertically. And through the centre runs the steel cable, which is fastened at each end of the raft by cap plates, the latter being provided with eyes to which the towing lines are attached. This method of construction allows the raft to be broken up section by section, within any impairment of the strength of those remaining.

Hitherto logs to be used for piling have been shipped to Boston by schooner, the loading and unloading, of which, require considerable time, but this method of rafting does away with much delay. To have transported 7,000 logs to Boston 15 schooners would have been needed.

The raft was towed from Port Greville by the ocean-going tug Underwriter, and the trip was made in nine days. The captain of the tug felt uneasy on two occasions, when storms threatened the safety of his tow. Once he was compelled to make harbor at Portland, but he arrived in Boston without any other damage than a slight twisting at one end of the raft.

DALHOUSIE, N.B., RISING FROM ITS ASHES.

The little town of Dalhousie, N.B., will shortly rise from the ashes in which it has been partially buried since the great fire of last year. In a few weeks the Dalhousie Lumber Company will place a hundred men at work to build two modern mills. A saw mill and rossing mill combined will be erected at the lower end of the town, near the old site at a probable cost of \$110,000, and will employ on an average 125 men. A new shingle mill will also be built, which will give employment to a large number of hands. The company expect to turn out forty to fifty million of shingles per year. One thousand men will be employed by the company in the woods and about two hundred in Dalhousie. The capital of the new company has been more than doubled. The officers for the ensuing year are: Board of Directors, James Manchester, St. John; W. T. Whitehead, Fredericton; Henry Hilyard, St. John; Messrs. Groffin and Underwood, New York. The local managers are A. H. Hilyard and H. A. Hilyard, Dalhousie.

NO EVIDENCE OF HARD TIMES.

In a letter to the CANADA LUMBERMAN, Mr. Thomas Pink, the well known manufacturer of lumbering and driving tools, of Pembroke, Ont., advises us that he is exceptionally busy in getting out orders, press of business prevents him thinking of hard times, which he would be inclined to think were imaginary only, if some people did not keep advertising the fact. Mr. Pink, further adds: "When you remind me of being one of the oldest manufacturers, it calls to my mind that I have been making lumbering tools since 1866, but the time has gone so fast that I really did not think I had been at it so long."

Regulations re Forest Reserves

(Recently Issued by the Federal Government.)

TRESPASS.

1. No person shall locate or settle upon any lands within a Dominion Forest Reserve hereinafter referred to as a Forest Reserve; and no person shall use or occupy any of such lands, except under the provisions of the Dominion Forest Reserves Act hereinafter referred to as the Reserves Act, or of these or any future regulations made thereunder.

2. Except as provided by the Reserves Act, no person shall enter or pass into, across or through any Forest Reserve without special permission from the Superintendent of Forestry or from the officer in charge of that Reserve.

3. Every person entering or passing into, across or through any part of a Forest Reserve shall when requested so to do by any Forest Ranger or any other officer having charge of or jurisdiction within such Reserve truthfully answer any enquiries made to him by such Ranger or officer, as to his name, his post office address, the duration or the proposed duration of his stay in the Reserve and the portion thereof he intends to visit or has visited; and shall give other information of a similar nature as such Ranger or officer may ask him for.

4. Any person contravening the foregoing provisions of these regulations shall be guilty of a trespass and may be removed from the Reserve by a Forest Ranger or any other officer having charge of such Reserve or jurisdiction therein, and such Forest Ranger or officer is justified in using force, but no more force than may be necessary to prevent any person from entering the Reserve or to remove him therefrom.

5. No person shall remove, deface, or destroy any notice posted in or near a Forest Reserve in regard to the prevention of forest fires, or any other matter relating to the administration of Forest Reserves, or any post, or other mark indicating the boundary of a Forest Reserve.

FIRES.

6. No person shall at any time set out or cause to be set out or started any fire in the open air in any Forest Reserve, except for the purpose of cooking, obtaining warmth, or for some industrial purpose permitted by the Minister of the Interior to be carried on; and every person who makes or starts a fire in the open air for cooking or camping purposes shall—

(a) Select a bare rock whereon to kindle such a fire wherever possible, and if there be no bare rock in the neighborhood, then a site on which there is the smallest quantity of vegetable matter, dead wood, branches, brushwood, dry leaves or resinous trees.

(b) Clear the place in which he is about to light the fire by removing all vegetable matter, dead trees, branches, brushwood and dry leaves from the soil within a radius of ten feet from the fires.

(c) Exercise and observe every possible precaution to prevent such fire from spreading, and carefully extinguish the same before quitting the place.

7. Any person who throws or drops any burning match, ashes from a pipe, lighted cigar or any other burning substance, or who discharges any firearms within a Forest Reserve, shall completely extinguish before leaving the spot the fire of such match, ashes of a pipe, cigar, wadding of the firearm, or other burning substance.

8. Every person cutting timber in a Forest Reserve and every person located in or traveling or passing through a Forest Reserve shall be required to comply with all the provisions of any Act or Regulations established by the Government of the Dominion, or of any Province or territory in which the Reserve is situated, for the protection of forests against fire, and any breach of such Act or regulations shall be held to be a breach of the regulations hereby established, and shall render the person making such breach liable to any penalty provided by the Reserves Act.

9. Any person who shall directly or indirectly, personally or through any servant, employe or agent, (a) kindle a fire or let it run at large on any land not his own property; (b) permit any fire to pass from his own land; (c) or allow any fire under his charge, custody or

control or under the charge, custody or control of any servant, employe or agent to run at large; with the result that such fire shall pass into any Forest Reserve, shall be liable, in addition to any penalty imposed by any provincial Act, to the penalty imposed by the Reserves Act for breach of these regulations.

10. Every person in charge of any drive of timber or survey or exploring party or of any other party in any Forest Reserve shall provide himself with a copy of these Regulations and shall see that the men under his charge are fully informed of the provisions thereof; and in case a breach of these regulations is committed by any of them he shall be liable to the penalty for such breach as if it had been committed by himself, unless he establishes that such breach was committed without his knowledge and contrary to his instruction; but such liability on the part of the person in charge of any such party shall not relieve any member of his party from personal liability for any such breach.

11. Every locomotive steam engine passing on a railroad through a Forest Reserve or through any part thereof shall, by the company or authority using the same be provided with and have in use all the most improved and efficient appliances to prevent the escape of fire from the furnace or ashpan or from the smokestack of such engine, and it shall be the duty of every engineer in charge of any such engine to use all necessary means and appliances to prevent the escape of fire from any such locomotive.

12. Every railway company operating a railroad by the power of steam in the Provinces of Manitoba, Saskatchewan or Alberta shall, where such railroad passes through a Forest Reserve, establish and maintain along the line thereof of such points and for such distances as may be decided by the Minister of the Interior to be necessary, on each side of such line of railroad and of such width not more than three hundred feet from the centre of the railroad as may be decided by the Minister, a good and sufficient fire guard to be made by ploughing the land to the extent of not less than fifteen feet in width on the side of the fire guard farthest from the railroad and by burning or otherwise freeing from inflammable material the spaces between such ploughing and such line of railroad: Provided, however, that no fire shall be started for the purpose of clearing such fire guard until three days' notice in writing has been given to the fire ranger in charge of the Forest Reserve.

13. Every railway company shall, at all times, keep such fire guards free from weeds and other inflammable material and in such condition as not to allow fire to spread therein and therefrom through coals, cinders or sparks falling from or emitted from locomotive steam engines.

PERMITS TO CUT TIMBER.

26. Permits for the cutting of timber in the Forest Reserves may be granted by the Superintendent of Forestry or by any other officer appointed for that purpose acting under his instructions, subject to the conditions hereinafter stated.

27. No timber except dry or fallen timber, shall be cut in the Moose Mountain, Turtle Mountain, Spruce Woods or Cypress Hills Forest Reserves until otherwise ordered by the Minister of the Interior.

28. The cutting of timber shall be permitted only within such areas as may be designated by the Officer in charge of the Reserve, and no permit shall authorize or be accepted as authorizing the cutting of timber outside of such areas.

29. Permits shall be granted only to actual settlers living within fifty miles of the nearest boundary of any Reserve, and except as hereinafter specifically provided any timber so granted shall be for the sole use of the permittee upon the land occupied by him as a farm.

(b) Permits shall expire on the first day of May next succeeding the date of issue and no person shall be entitled to more than one permit in one year of each class provided for by these regulations. Each permit shall designate the location in which the cutting is to be done and the quantities and classes of timber to be cut thereunder, and immediately after expiry shall be returned to the officer by whom it was issued with a sworn statement of the timber cut. In case of failure by a permittee to return his permit with a sworn statement, he shall not be granted another permit, provided, however, that if a permit has been inadvertently lost or destroyed, a sworn statement in form satisfactory to the Minister may be accepted in lieu thereof. The fee for a permit shall be twenty-five cents.

(c) Before the issue of a permit the fee and dues in connection therewith shall be paid in full.

30. Permits to cut dry wood up to twenty-five cords may be granted free of dues.

31. Permits to cut dry wood for sale or barter up to one hundred cords may be granted on payment of dues at the rate of twenty-five cents per cord.

32. Any bona-fide occupant of a homestead within fifty miles of the nearest boundary of any Forest Reserve who has the right to a permit to cut timber free of dues under the provisions of section twenty of the Regulations governing the granting of yearly licenses and permits to cut timber on Dominion lands established by an Order in Council dated the first of July, 1898, as amended by subsequent Orders in Council, or who may acquire the right under the said regulations and amendments thereto, may be granted a permit to exercise such right within any Forest Reserve covered by the regulations hereby established, but the permittee must comply with the requirements of the regulations hereby established or of any amendment thereto.

33. Bona-fide settlers who have not a sufficient supply on their own farms may, upon payment of the dues hereinafter prescribed, be granted permits for the quantities of timber and in accordance with the provisions hereinafter stated:

Ten thousand feet board measure of building logs for lumber. No tree to be cut which is of less diameter than ten inches breast-high or at four and one-half feet from the ground. Dues to be charged at the following rates:

Poplar\$1.50 per thousand feet.

Other species\$3.00 per thousand feet.

Five hundred fence posts seven feet long, not to exceed five inches in diameter at the top:

Poplar and willow2 cents each.

Other species5 cents each.

Five hundred fence rails or roof poles, not to exceed six inches in diameter at the butt:

Poplar only2 cents each.

One thousand lineal feet of round building material, no log to exceed twelve inches in diameter at the butt:

.....1 cent per lineal foot.

Fifteen cords of fuel:

Poplar only\$1.00 per cord.

34. All cutting upon the Reserves shall be done under the control of the officer in charge thereof and the permittee shall be required to avoid all unnecessary waste or destruction of timber. All parts exceeding four inches in diameter of trees cut down shall be removed by the permittee. Any breach of this regulation by the permittee or failure to comply with the instructions of the officer in charge of the Reserve or of the forest ranger shall render the permit liable to cancellation and, in the discretion of the Minister of the Interior, the privilege of obtaining any further or other permit within a Forest Reserve may be withdrawn.

35. All timber cut within a Forest Reserve without the authority of a permit or outside of the areas within which cutting is allowed as hereinbefore provided shall be liable to seizure, whether in the possession of the person by whom it was cut or of any other person and whether it has or has not been removed from the Reserve; and a fine equivalent to at least double dues shall be collected on the whole quantity cut, whether partly covered by a permit or not, and the person by whom the timber was cut shall forfeit all right to obtain a permit within a Forest Reserve, in addition to any other penalty provided by the Reserves Act, or by these regulations.

(b) Any timber so seized and upon which the dues are not paid may be disposed of by public auction after proper advertisement, and, if no bid equal to the amount due the Government is received, may be disposed of by private sale.

(c) Any officer in charge of a Forest Reserve or any Forest Ranger appointed to act therein shall have authority to make seizures of timber as herein provided.

36. When in any of the foregoing regulations it is provided that the permission of the Superintendent of Forestry or of any Forest Ranger or other officer having charge of or jurisdiction within any

Forest Reserve, is necessary, it is understood that such permission shall be in writing over the signature of such Superintendent, Forest Ranger or other officer.

PENALTIES.

37. As provided by section 15 of the Reserves Act, any person violating any provision of these regulations shall, in addition to any civil liability thereby incurred, be liable, on summary conviction, to a penalty of not more than one hundred dollars, and in default of immediate payment of such penalty and of the cost of prosecution such person may be imprisoned with or without hard labor for any term not exceeding six months.

UNUSUAL ACTIVITY AT MILLSIDE, B.C.

Although the cutting of lumber, by the Fraser River Saw Mills, Limited, of Millside, B.C., has been suspended for some time past, things are by no means quiet, or inactive, around the historic site of the old Ross-MacLaren plant. The thud of the pile-driver, the din of the hammer and riveter, and the noise of the cross-cut saw, all contribute their quota to the medley of sounds that bespeak considerable activity on the banks of the mighty Fraser.

Reconstruction is the order of the day, the rebuilding of the entire plant of the Fraser River Saw Mills, Limited, being in process. The entire mechanical equipment, which was only installed during 1906, but which has since been found too light for the demand put upon it, has been torn down and will be practically all disposed of; new machinery of a heavier order, and the latest in design, having been purchased. The initial step in the remodeling of the plant is the building of new foundations under the building. This is under way, at the time of writing the old floor being torn up, and the pile-driver at work inside the building.

The new machinery includes one new 11-inch band saw mill, two 9 1-2 inch band saw mills, of Allis-Chalmers manufacture; a new Wickes Bros. gang mill, and an entirely new complement of edgers, trimmers, slashers, live rolls and transmission system, also a new lath mill outfit. The power plant has been overhauled and one new single Corliss engine and one twin engine will be installed. Both are being supplied by the Allis-Chalmers Company. Steam for these will be produced from sixteen 72 inch x 18 foot Goldie & McCulloch Company, Limited, boilers, having a total of 2,450 horse-power, nominal.

With this equipment it is expected that the mill will have a capacity of 300,000 feet per ten hours. To facilitate their cargo trade, the dock will be extended about 500 feet. They are also about to build a large new office building, store and post office.

The Fraser River Saw Mills, Limited, passed into new ownership a few months ago, the officials of the new company being: President, A. D. McRae, of Winnipeg; 1st vice-president, Peter Jansen, of Jansen, Neb.; 2nd vice-president, Lester W. David, of Seattle, Wash.; secretary, R. H. Brown, Millside, B.C., and treasurer, Frank Donnelly. The mill manager is Mr. W. S. Roger who, until the 1st of December last, when he came to Millside, B.C., had been for the previous twenty-five years connected with the Weyerhouser Company at Everett, Wash.

A LARGE WOOD-RIM WHEEL.

After an accident to a flywheel in a large European electric station, the superintendent designed and had constructed a flywheel of wood which has a diameter of over 35 feet and a rim width of 10 feet. The thickness of the rim is about 12 inches, and it is made up of 44 thicknesses of beech planks, with staggered joints. The boards were glued together and then bolted. The inside consists of a double wheel, the 24 spokes of which are fastened to two hubs. The spokes and hubs are of cast iron. The wheel is operated at 76 revolutions per minute, which corresponds to a peripheral speed at the rim of 139 feet per second or 94 miles per hour. This is said to constitute a record for wooden flywheels.—Power.

POOL AND HURST DISSOLVE PARTNERSHIP.

Pool & Hurst, who have been doing a lumber, coal and contracting business at Glencoe, Ont., have dissolved partnership. Mr. T. K. Pool retires, while Mr. J. E. Hurst will continue the business.

Coast Lumbering Growth

The year just closed has witnessed most remarkable progress throughout the whole world, but nowhere more than in Canada's "Premier Province—British Columbia." The development of this province means in a large measure the development of her lumbering interests, and truly, in this respect has the year 1907 seen a wonderful advance over all previous years, as the following list will show. This list represents only those companies which have incorporated—there are others formed which have not incorporated:—

Alberni Mills & Turner Company, Limited, incorporated September 23rd, 1907. Capitalized at \$250,000. Shares, \$100.00 each. Present head office in Ballard, Wash. Mill to be built next year at Alberni, Vancouver Island, B.C.

Anderson Logging Company, Limited, incorporated June 4th, 1907. Capitalized at \$50,000. Shares, \$100.00. Interests located on the coast.

Adams River Lumber Company, Limited, incorporated June 25th, 1907. Capitalized at \$500,000. Shares, \$100.00. Among those interested are J. P. McGoldrick, Spokane, Wash., and Mr. Lammars, Stillwater, Minn.

British Columbia Timber & Forestry Chamber of Commerce, incorporated November 19th, 1907, under the Benevolent Societies' Act. Head office, Room 7, Jones Block, Vancouver. President, E. P. Bremner; Secretary-Treasurer, Dr. Judson F. Clark. Object: The betterment of timber and forestry conditions throughout the province.

British Columbia Cedar Lumber Company, Limited, incorporated July 20th, 1907. Capitalized at \$200,000. Shares, \$100.00.

Burley Lumber Company, Limited, incorporated January 25th, 1907. Capitalized at \$50,000. Shares \$100.00. Head office, New Westminster, B.C. W. S. Burley, manager.

British Canadian Lumber Company, Limited, incorporated February 4th, 1907. Capitalized at \$1,000,000. Shares \$1.00 each. Registered office, care of Geo. A. Morphy, Board of Trade Building, Victoria, B.C.

British America Lumber & Trading Company, Limited, incorporated February 11th, 1907. Capitalized at \$100,000. Shares, \$100.00. Wholesalers of lumber. J. R. Owens, manager, 118 Hastings street, Vancouver.

B. C. Loggers' Association, incorporated April 25th, 1907, under the Benevolent Societies Act. President, Theo. Magnesen; Secretary, Joseph Buch. Object: The production and promotion of the logging interests of British Columbia.

B. C. Northern Land & Timber Company, Limited, incorporated May 10th, 1907. Capitalized at \$100,000. Shares, \$1.00. J. F. Stewart, managing director, Fairfield Building, Vancouver, B.C. Company inactive at present.

The Joseph Chew Lumber & Shingle Manufacturing Company, Limited, incorporated April 27th, 1907. Capitalized at \$100,000. Shares, \$100.00. Head office and mill, False Creek, Vancouver. Joseph Chew, manager. Succeeding the shingle business previously carried by Joseph Chew.

Campbell River Booming Company, Limited, incorporated May 29th, 1907. Capitalized at \$50,000. Shares, \$1.00. Interests located on Campbell River, Vancouver Island, B.C.

The Coast Timber & Trading Company, Limited, incorporated July 9th, 1907. Capitalized at \$50,000. Shares, \$100.00. Head office at Calgary, Alberta; B. C. office, in Vancouver. Daniel Webster Trotter, being attorney for the company in Vancouver.

Canadian American Timber Company, incorporated September 10th, 1907. Company to exist for fifty years from first day of May, 1907. Head office, Seattle, Wash.; B. C. office, Vancouver. Frank C. Raney being attorney for the company. Capitalized at \$30,000. Shares, \$100.00.

Campbell Shingle Company, Limited, incorporated November 11th, 1907. Capitalized at \$10,000. Shares \$100.00.

Columbia River Timber & Transportation Company, Limited, incorporated December 6th, 1907. Capitalized at \$50,000. Shares, \$100.00.

Chilliwack Manufacturing Company, Limited, incorporated Decem-

ber 9th, 1907. Capitalized at \$15,000. Shares, \$50.00. Lumber manufacturers at Chilliwack, B.C.

Eburne Shingle Company, Limited, incorporated June 29th, 1907. Capitalized at \$10,000. Shares, \$10.00. Mill located at Eburne, B.C. J. W. Mackay, general manager.

Funnell Logging Company, Limited, incorporated April 25th, 1907. Capitalized at \$10,000. Shares, \$100.00. Soon after incorporation this company's interests were sold to Messrs. Dempsey & Doherty, Vancouver.

Fullerton Lumber & Shingle Company, Limited, incorporated May 18th, 1907. Capitalized at \$50,000. Shares, \$1.00. Wholesale dealers in lumber and shingles. Head office, 633 Hastings street, Vancouver.

Grand Trunk Lumber Company, Limited, incorporated January 30th, 1907. Capitalized at \$10,000. Shares, \$100.00. Messrs. Bird & Brydonjack, Vancouver, are solicitors for this company, the manager being J. M. Duncan, Port Essington, B.C.

Graham Island Lumber Company, Limited, incorporated May 22nd, 1907. Capitalized at \$30,000. Shares, \$100.00. Interests of this company are located on Graham Island, in the Queen Charlotte group, off the coast of B.C. B. F. Graham, Douglas Building, Los Angeles, Cal., is head of this company.

Gibbon's Lumber Company, Limited, incorporated May 11th, 1907. Capitalized at \$250,000. Shares, \$100.00. Mill at Pingston Creek, on the Arrow Lake. Rand Gibbons, Arrowhead, B.C., is manager.

Hill-Tout Lumber Company, Limited, incorporated February 9th, 1907. Capitalized at \$50,000. Shares, \$100.00. Mill located at Abbotsford, B.C.

E. H. Heaps & Company, Limited, incorporated June 11th, 1907. Capitalized at \$1,500,000. Shares, \$100.00. Head office, Powell street, Vancouver. Succeeding the lumber manufacturing business of E. H. Heaps & Company.

Independent Shingle Company, Limited, incorporated March 25th, 1907. Capitalized at \$50,000. Shares, \$100.00. Head office and plant, New Westminster, B.C. P. D. Roe, president; W. B. Welbon, manager. Succeeding the shingle manufacturing concern known as the Fraser River Lumber Company.

Island Logging Company, Limited, incorporated April 22nd, 1907. Capitalized at \$25,000. Shares, \$1.00. Interests on Salt Spring Island, in Gulf of Georgia, B.C. R. T. Elliott, Victoria, is solicitor for the company.

Imperial Shingle Company, Limited, incorporated June 18th, 1907. Capitalized at \$25,000. Shares, \$50.00. Mill on False Creek, Vancouver. President, R. J. Crawford; Manager, Z. Giberson.

Jordan River Lumber Company, Limited, incorporated May 31st, 1907. Capitalized at \$300,000. Shares, \$100.00. Head office, Turnet-Beeton Wharf, Victoria. President and General Manager, Mr. I. D. Calhoun.

Kyugnot Sound Lumber Company, Limited, incorporated June 26th, 1907. Capitalized at \$100,000. Shares, \$10.00. The registered office of this company is in Victoria, B.C.

Leask Lumber Company, Limited, incorporated January 21st, 1907. Capitalized at \$75,000. Shares, \$10.00. Object: To acquire the lumber manufacturing plant at Goat River Canyon (Kitchener), B.C. Operated by Thos. W. Leask.

Lynn Valley Lumber Company, Limited, incorporated March 4th, 1907. Capitalized at \$25,000. Shares, \$1.00. Plant now owned and operated by J. M. Fromme, North Vancouver, B.C.

Lea Lumber Company, Limited, incorporated August 10th, 1907. Capitalized at \$50,000. Shares, \$100.00. Mill to be at Wigwan, B.C., near Revelstoke.

North Coast Lumber Company, Limited, incorporated November 6th, 1907. Capitalized at \$1,000,000. Shares, \$100.00.

Moresky Lumber Company, Limited, incorporated June 28th, 1907. Capitalized at \$500,000. Shares, \$100.00. N. A. Mellor, secretary, 34 1-2 Government street, Victoria, B.C.

McNair-Fraser Lumber Company, Limited, incorporated June 10th, 1907. Capitalized at \$200,000. Shares, \$100.00. Head office, 440 Westminster avenue, Vancouver. President and General Manager, Jas. A. McNair, Vancouver.

Mott-Boulton Lumber Company, Limited, incorporated August 8th, 1907. Capitalized at \$10,000. Shares, \$100.00. Mill and head office at Elkmouth, B.C.

Merrill & Ring Lumber Company, Limited, incorporated July 5th, 1907. Capitalized at \$500,000. Shares, \$100.00. Head office of company, 1011 Alaska Building, Seattle.

Northwest Lumber Company, Limited, incorporated February 7th, 1907. Capitalized at \$500,000. Shares, \$100.00. Head office of company, 1011 Alaska office, 15 William Building, Vancouver. Later—This company has gone into liquidation.

The Northern Pioneer Lumber Company, Limited, incorporated May 11th, 1907. Capitalized at \$15,000. Shares, \$10.00. Head office, Atlin, B.C. Membership of firm includes G. D. Sinclair, Johnston Woods and Fred. A. Taylor, all of Atlin.

The North Arm Lumber Company, Limited, incorporated July 4th, 1907. Capitalized at \$200,000. Shares, \$100.00. Mill located on North arm of Fraser River, at Eburne, B.C. Head office, Empire Building, Vancouver. R. H. McKee, president and general manager.

The North American Shingle Company, Limited, incorporated September 3rd, 1907. Capitalized at \$25,000. Shares, \$10.00. The promoter of this company is W. J. Kerr, of New Westminster, B.C.

Nicola Valley Lumber Company, Limited, Crawford, B.C., incorporated September 16th, 1907. Capitalized at \$50,000. Shares, \$100.00. Saw mill operators at Nicola Valley, B.C.

Norman Plass Lumber Company, Limited, incorporated September 19th, 1907. Capitalized at \$250,000. Shares, \$100.00.

New Westminster Logging Company, Limited, incorporated October 14th, 1907. Capitalized at \$10,000. Shares, \$100.00. Acquired interests of John Hudson & Company, loggers.

Patrick Lumber Company Limited, incorporated January 23rd, 1907. Capitalized at \$200,000. Shares, \$100.00. Head office, at Nelson, B.C. Mill on Slocan branch of C.P.R.

The Pacific Coast Lumber Mills, Limited, incorporated February 12th, 1907. Capitalized at \$600,000. Shares, \$100.00. Head office, Georgia street, Vancouver. G. F. Gibson, manager. Succeeding the Pacific Coast Lumber Company, Limited.

Paterson Timber Company, Limited, incorporated February 19th, 1907. Capitalized at \$125,000. Shares, \$100.00. Head office, Inns of Court Building, Vancouver. I. Frank Paterson, manager. Succeeding the Paterson Timber Company.

Prince Rupert's Timber & Lumber Company, Limited, incorporated July 12th, 1907. Capitalized at \$450,000. Shares, \$100.00. Head office of Company, 48 Sparks street, Ottawa; B.C. office, 439 Richard street, Vancouver. E. H. Moore, manager.

Piper Trading & Lumber Company Limited, incorporated October 1st, 1907. Capitalized at \$60,000. Shares, \$100.00. Mill at Burnaby Lake, B.C. C. T. W. Piper, manager, Vancouver, B.C.

The Summerland Lumber Company, Limited, incorporated January 26th, 1907. Capitalized at \$150,000. Shares, \$100.00. Head office, Summerland, B.C. J. M. Robinson, manager, Beach avenue, Summerland.

The Quesnelle Lake Timber Company, Limited, incorporated August 29th, 1907. Capitalized at \$75,000. Shares, \$5.00. To take over the interests named in an agreement between Elijah John Fader, of New Westminster, and Henry Lovekin Edmonds.

Ross-Saskatoon Lumber Company, Limited, incorporated April 27th, 1907. Capitalized at \$500,000. Shares, \$100.00. Head office, Waldo, B.C. D. H. Telford, president; H. H. Ross, general manager. Succeeding Ross Bros. & Company, of Elkmouth, B.C.

The Rideau Lumber Company, Limited, incorporated May 20th, 1907. Capitalized at \$40,000. Shares, \$10.00. Head office, Waldo, B.C. J. O. Clothier, manager.

Roe & Abernethy, Limited, incorporated May 21st, 1907. Capitalized at \$350,000. Shares, \$100.00. Incorporated to take over the lumber interests of Perry D. Roe and Abernethy Bros. Head office, Port Moody, B.C. P. D. Roe, manager.

The S. C. Smith Lumber Company, Limited, incorporated January 21st, 1907. Capitalized at \$100,000. Shares, \$100.00. Head office at Vernon, B.C. Succeeding the lumber manufacturing concern of S. C. Smith.

Port Douglas Lumber & Trading Company, Limited, Harrison River, B.C., incorporated December 9th, 1907. Capitalized at \$100,000. Shares, \$100.00.

Squamish Timber Company, Limited, incorporated March 21st, 1907. Capitalized at \$250,000. Shares, \$100.00. Head office of company, 46 Flock Block, Vancouver.

Silverton Lumber & Power Company, Limited, incorporated April 20th, 1907. Capitalized at \$30,000. Shares, \$100.00.

Summit Lake Lumber Company, Limited, incorporated May 18th, 1907. Capitalized at \$100,000. Shares, \$100.00. O. L. Boynton, of Fernie, B.C., and associates are interested in this company.

The Sunset Timber & Lumber Company, Limited, incorporated July 22nd, 1907. Capitalized at \$300,000. Shares, \$100.00.

Squamish River Boom Company Limited, incorporated August 17th, 1907. Capitalized at \$10,000. Shares, \$100.00. Noah Adams, of Squamish, B.C., is interested.

Stacey & Garland, Limited, incorporated August 20th, 1907. Capitalized at \$300,000. Shares, \$5.00. Head office, 328 Granville street, Vancouver. These people took over the interests of the Edmonton Logging Company.

The Squamish Valley Shingle Bolt Company, Limited, incorporated August 20th, 1907. Capitalized at \$25,000. Shares, \$50.00. Head office, 1605 Georgia street, Vancouver.

Shuswap Lumber Company, Limited, incorporated September 19th, 1907. Capitalized at \$50,000. Shares, \$100.00.

Scott Cove Timber Company, Limited, incorporated September 20th, 1907. Capitalized at \$50,000. Shares, \$100.00. Office, 27 Imperial Block, Vancouver, President, U. K. Loose; Secretary, J. C. McCarth.

Saanich Lumber Company, Limited, incorporated October 15th, 1907. Capitalized at \$100,000. Shares, \$1.00. Messrs. M. Carlin and J. G. Billings, of Victoria (late of Golden & Nelson, B.C., respectively), are at the head of this concern.

Sim's Timber Company, Limited, incorporated December 9th, 1907. Capitalized at \$250,000. Shares, \$100.00. Office, Room I, Davis Chamber, Vancouver.

Thurlow Lumber Company, Limited, incorporated January 14th, 1907. Capitalized at \$25,000. Shares, \$100.00. Head office, 2027 Granville street, south Vancouver. President, A. E. Coffin; Secretary, D. C. Little. Mill and limits on Thurlow Island, B.C.

The Terminal Lumber & Shingle Company, Limited, incorporated July 26th, 1907. Capitalized at \$100,000. Shares, \$10.00. President, T. F. Paterson; Manager, W. Cooke. Succeeding Cooke & Tait Lumber Company, Vancouver.

Victoria Tie & Timber Company, Limited, incorporated March 12th, 1907. Capitalized at \$10,000. Shares, \$10.00. Solicitor of company is R. T. Elliott, Victoria. W. A. Ward, Victoria, B.C., is a member of this firm.

Vancouver Island Timber Company, Limited, incorporated May 17th, 1907. Capitalized at \$100,000. Shares, \$100.00. Manager, John Arbuthnot, Metropolitan Building, Government street, Victoria.

The Vancouver Island Logging & Mill Company, Limited, incorporated June 19th, 1907. Capitalized at \$100,000. Shares, \$10.00. H. Maurice Hills, Victoria, B.C., is solicitor for this company, to whose office communications may be addressed.

The Valley Timber Company, Limited, incorporated August 17th, 1907. Capitalized at \$25,000. Shares, \$50.00. Head office, 1605 Georgia street, Vancouver. G. F. Gibson, director.

The Westholme Lumber Company, Limited, incorporated January 18th, 1907. Capitalized at \$25,000. Shares, \$10.00. Succeeding the lumber manufacturing business of Frank Lloyd, Westholme, Vancouver B.C. Among those interested are Chas. D. McNab, of Cranbrook, and Island, B.C.

Wilson Logging & Timber Company, Limited, incorporated March 13th, 1907. Capitalized at \$50,000. Shares, \$100.00. Head office, 45 Davis Chambers, Vancouver. P. A. Wilson, manager.

The Watkins Logging & General Contract Company, Limited, incorporated October 3rd, 1907. Capitalized at \$100,000. Shares, \$1.00.

The Western Lumber Company, Limited, incorporated June 5th, 1907. Capitalized at \$50,000. Shares, \$10.00. Head office at Fernie, R. W. Wood, of Fernie.

Market Correspondence

ACTIVITY IN THE OTTAWA VALLEY.

Ottawa, Feb. 8, 1908.—A small quantity of the coming season's lumber cut has been contracted for by British buyers at last year's prices. A prominent manufacturer states that in some cases the 1907 figure has been exceeded and believes that holders of lumber may rely upon as high rates next summer as ever obtained. It is felt in Ottawa that much will depend upon the prices set by manufacturers of pine in this city as to the general market for pine the coming summer. Many agents have been making inquiries, but not enough contracts have been concluded to warrant a definite statement of prices or comparison with last year's rates. The unsettled state of the money market is largely responsible for this. One large dealer asserts that the financial stringency has practically tied up all lumber business in certain quarters and it is quite evident that the whole field is similarly affected.

The recent snows and cold weather have been of remarkable assistance in shanty operations and the work of hauling goes on satisfactorily. It is evident now that the smallest mill owner will be unable to produce as much lumber next summer as last owing to the smaller cut of logs, but half a dozen of the manufacturers have such a large supply of logs ahead as not to be affected by the curtailment of the winter operations. J. R. Booth is preparing his mill for a larger capacity for the 1908 cut. Owing to the extent of repairs now going on, no lumber has been sawed in the Booth mill this winter. Although repairs are made every winter it is necessary, about once in a decade to completely overhaul the plant and when this is done, as now, operations have to cease entirely. A year ago the Booth mill was operating to fill rush orders.

The estate of the late Robert Hurdman, whose cut last summer amounted to about four millions, sawn in R. & T. Ritchie's mill, are not operating in the woods this winter, but have some logs which will be cut next summer. When these are manufactured into lumber the operations of the firm will cease.

The reconstruction of James Davidson's lumber mill at Fort Coloungé, which was burnt in 1906, had the effect of increasing the lumber output last year to five million feet from one million the year before.

The Ottawa Valley members in the House of Commons are urging the federal government to moderate the construction of the Georgian Bay Canal. At Ottawa the plan is to pass the Chaudiere Falls by a canal north of Hull. The various works proposed would greatly increase the water power at the Chaudiere as well as at other points along the Ottawa River.

Some interesting information concerning the amount paid by lessees of Chaudiere water powers is contained in a return brought down to Parliament this week. Disputes having arisen between the original leases of the hydraulic lots and the government, the lessees on November 19, 1889, paid to the Crown the accrued rents due, amounting to the sum of \$64,685. The lessees at the same time surrendered the lots to the Crown and new leases were issued to W. G. Perley, et al, J. R. Booth, R. Blackburn, Margaret Petrie, A. H. Baldwin, Bank of Montreal, Milton Merrill, and the Bronson & Weston Lumber Company. Each of the leases has to run 21 years, from January 1, 1890, renewable at similar periods of 21 years forever. The annual rental was \$100 for each lot which amount to about 150 horse-power.

The lessees are:—

J. R. Booth—Lease of land, south westerly end of Union Bridge at Chaudiere Falls. Area 9,714 square feet. Rent \$150 per annum.

Colin Dewar—Lease of land of Victoria Island, Chaudiere, Ottawa. Area 2,244 square feet. Date July 15, 1891. Rent \$5 per annum. Duration good pleasure.

The Ottawa Electric Company—Land at Chaudiere Island, small reserve. Date of lease, January 11, 1898. Duration 20 years. Rent \$10 per annum.

The Bronson Company—Lease of a portion of Amelia Island, Ottawa. Area 7,500 square feet. Date October 9, 1900. Rent \$100 per annum.

The Upper Ottawa Improvement Company—Lease of portion of government reserve, Victoria Island, Ottawa. Area 1,947 square feet. Date December 22, 1903. Duration 10 years. Rent \$2 per annum.

MARITIME TRADE STILL SLOW.

St. John, N.B., Feb. 10, 1908.—Since last writing conditions bearing upon logging operations have changed materially. The change, which has been entirely in favor of the operator, came at an opportune moment, and it seems just now as if the threatened log famine will not materialize. During the last fortnight several heavy falls of snow have occurred in all parts of the province. The total fall so far in the upper St. John river sections amounts to from two to two and one-half feet. Operators are rushing the work of hauling to the brows and already large quantities of cedar and spruce have been piled along the banks of the brooks and streams.

Local conditions which have a bearing on the trade of the coming season evince some interesting features on the manufacturing as well as on the selling end. There is no doubt that several local concerns, both manufacturers and dealers, were caught last year when the bottom fell out of the lumber market, and it is equally sure that they will be on the safe side this year, if present indications are a standard by which to judge.

With the St. John river driven clean of logs last year and the present season's cut of logs from 40 per cent. to 50 per cent. smaller than was the case last season, the mill owners figure that they will be in a position during 1908 to either saw their logs or hold them, and are quite prepared, in nearly every case, to do the latter if they cannot sell their product at a fair margin of profit.

The operations of local dealers are marked by extreme caution and transactions are such as will supply only immediate needs. At this season of the year it is usually possible, by sizing up the trend of the local market, to form some idea of what the season is apt to bring forth in the way of prices, but this year anything in the way of a forecast is little better than a guess; there is little or nothing doing and the dealers, like the manufacturers, are waiting and doing their best to avoid being tied up to any extent. It is quite certain that prices which would be quoted a prospective seller would not be of an attractive nature.

Any spruce lath which might go on the local market would not bring at present more than \$2.10 to \$2.20 per thousand (dutable) f.o.b., St. John, while one inch spruce boards, also dutiable, could not be disposed of at any greater figure than \$11 per thousand superficial feet, f.o.b., St. John.

An offering of the usual specifications of "English" deals might be disposed of at from \$12.50 to \$12.75 per thousand superficial feet, f.o.b., St. John.

TIMBER LOCATIONS WITHDRAWN.

The following Order-in-Council has appeared in the Ontario Gazette.

"Upon consideration of the memorandum of the Deputy Minister of Lands and Forests, and upon the recommendation of the Honorable the Minister of Lands, Forests and Mines, the committee of Council advise that lots which have been located or sold and consequently withdrawn from timber license for anything but pine timber shall remain so withdrawn so far as timber other than pine is concerned, even if the sales or location shall be subsequently cancelled for non-performance of settlement duties or any other cause."

LUMBER UNDERWRITERS.

The Lumber Underwriters, 66 Broadway, New York, who assume no risks other than those of lumber and lumber working plants, write us that they are receiving very satisfactory support from the lumber trade at large. Their policy at reduced rates makes a positive, immediate saving. Their yearly statement shows a surplus at the beginning of 1908 of \$117,555.

"TOWER" ONE MAN TWO-SAW TRIMMER.

In selecting machinery, too often the only element that is taken into consideration is the price. The purchaser overlooks the fact that he is buying the machine for what it will do, and not because it is cheap. There is a vast difference between both the quality and the quantity of the work done by machines of the same description built by different manufacturers; and this should be constantly borne in mind by the buyer. The "Tower" one-man two-saw trimmer, the product of the Gordon Hollow Blast Grate Company, of Greenville, Michigan, is claimed by the manufacturers to do more work in a given time than any other trimmer in the same class on the market, and that with less fatigue to the operator. This is claimed because, with other trimmers, every time the saws are to be set to cut a different length the operator has to go clear to the end of the machine, while with the "Tower" one-man two-saw trimmer, he goes only to the end of the board.

To see what this means, let us take an illustration. This machine trims from 6 to 24 feet, both lengths inclusive, and the machine is 26 feet 6 inches long, over all. We will take an extreme case, and suppose the operator has just trimmed a 6-foot board and is about to trim an 8-foot one. With an ordinary trimmer, he would have to walk from one end of the 6-foot board to the end of the machine and back to the end of the 8-foot board—a distance of 19 feet 6 inches. With the "Tower one-man two-saw trimmer," he would move only 1 foot, turning the crank one complete revolution as he did so. This would bring the saws 2 feet farther apart, each saw moving 1 foot in opposite directions. Thus this trimmer saves steps. This implies less fatigue to the operator, and more work, because there is less lost time.

But this method of shifting has another great advantage. As it

"TOWER" ONE-MAN TWO-SAW TRIMMER.

10

always leaves the operator right at the end of the board, regardless of whether it is short or long, he can see instantly how to trim the lumber, and not only that, but how to trim it to the best advantage. This means a still further saving of time, and prevents wasting good lumber by cutting off too much.

It must not be assumed that the "Tower" one-man two-saw trimmer is a high-priced machine, as we are assured by those in a position to know that, quite the contrary is the case. In fact, it so happens that in this instance the maximum of convenience and efficiency are found in a machine of moderate cost. This trimmer is made in ten different sizes and styles.

Those wishing to raise the grade of their lumber and make it sell more readily would do well to write the Gordon Hollow Blast Grate Company, Greenville, Michigan, for particulars concerning this machine.

SAW MAKING IN MONTREAL.

"In the St. Henry portion of the city," says a recent number of the Montreal "Witness," "are big works for the manufacture of saws, an industry that is making great strides under the direction of very able business men.

"These works were established in January, 1906, by one of the most famous saw manufacturing firms in the United States. The firm pur-

chased the three local saw-making companies, and built new works at St. Henri, where is now installed what is claimed to be the most complete and up-to-date saw and knife plant in Canada. Many skilled technical and executive men were brought from the company's American factories, and, although the plant has only been in operation about eighteen months, a large and constantly increasing trade is done with all parts of the Dominion, a considerable portion of it through distributing branches at Toronto and St. John, N. B.

PLANT OF SIMONDS CANADA SAW COMPANY, MONTREAL.

"The steel that is used is manufactured in the company's own works at Chicago and is brought in untempered to the Montreal works. The output includes a complete line of saws—circular, band, gang and cross-cut—as well as every kind of machine knife. The largest band saws made in the works are sixty feet long and eighteen inches wide, but the usual run is forty-seven feet long and from ten to twelve inches wide. The cross-cut saws for the British Columbia trade are nine and a

half feet long. Very few of these are used in the eastern lumbering camps, the size most favored in these, being from five to six and a half feet long. The circular saws are made in all sizes up to seventy-two inches in diameter, which is about the largest used in this territory. The company's machinery includes a six hundred horse-power gas producer plant, which, it is stated, is the largest industrial producer plant in the Dominion.

"The company has land between three and four thousand feet long and a hundred feet wide behind its present works, and it expects to extend the factory over the whole of this within the next five years."

The plant referred to is that of the Simonds Canada Saw Company, Limited, already well known among lumbermen.

A TREE OF MANY USES.

The Carnahuba Palm of Brazil, is said to be the world's most useful tree. A department store tree, you might call it, for it gives everything from medicine to cattle feed. Its roots make a very valuable drug, a blood purifier that is prescribed a good deal in the spring. Its timber takes a high polish and is in demand among cabinet makers for fine work. The sap becomes wine or vinegar, according to the way it is prepared and starch and sugar are also obtained from this sap. The fruit of the tree is a cattle food, the nut is a good coffee substitute, the pith makes corks.

WESTERN RETAIL LUMBERMEN'S ASSOCIATION.

The following circular letter has been sent to the members of the Western Retail Lumbermen's Association and policyholders of the Retail Lumbermen's Mutual Fire Insurance Company.

Winnipeg, Jan. 29, 1908.

Gentlemen:—

The seventeenth annual meeting of the Western Retail Lumbermen's Association will be held in the Commercial Travelers' Hall, corner of King and Bannatyne streets, Winnipeg, on Wednesday and Thursday the 19th and 20th of February, 1908, commencing on Wednesday the 19th, at 9 o'clock a.m., at which three interesting and instructive papers will be read.

The third annual meeting of the Retail Lumbermen's Mutual Fire Insurance Company will be held in the same place on Thursday the 20th, at which meeting all lumbermen who are interested, whether policyholders or not, are cordially invited to attend.

The date being during the bonspiel, the railway companies will grant tickets at bonspiel rates up to the 18th.

The annual "round-up" of the Western Hoo-Hoo will take place during the convention, in which function a large number of prairie lumbermen are expected to participate. The Vicegerent Snark of Central Canada has issued an order for the "black cats" to assemble.

During the Bonspiel Carnival there will be curling, hockey, skating, tobogganning, and other sports.

AFTER SOME BIG TIMBERS.

The purchasing agent for the Panama Canal is in the market for some big sticks of timber. It goes without saying that they will have to be bought on the Pacific coast, although the specifications call for yellow pine and Douglas fir. These are for dredgers. The dimensions of the big sticks are as follows: 236 x 36-60, 130 x 30-60, 124 x 24-60, 28 x 20-62, 28½ x 20-60, 17 x 19-24.

We Build Nine Different Types of Gangs and can meet your Requirements

Cut Illustrates our No. 4 or Steam Gang which does not require separate driving rig.

For those with limited space this machine is the ideal equipment.

B. C. TIMBER WEALTH

The receipts from British Columbia timber for the month of December last were the largest for any one month in the history of the province. From all sources connected with timber, the province received \$234,451.07, making the figure for the first six months of the present fiscal year \$958,125.63, an increase of \$390,794.38 over the receipts for the same period of the fiscal year of 1907.

The receipts for December were nearly \$100,000 more than the receipts during the heaviest month of the fiscal year preceding, which was May last, when from timber the province realized \$140,060.35. Each of the last four months have surpassed that total. The heaviest prior to December being November, when the provincial treasury was enriched by \$191,883.01.

As usual, the heaviest source was the fees from timber licenses. The total amount from that source was \$224,871.

The following table shows the revenue from timber for the first six months of the last and the present fiscal year:

	1906-07.	1907-08.
July	\$110,280.58	\$ 73,019.76
Aug. . . .	75,104.24	129,933.14
Sept. . . .	64,581.72	165,609.60
Oct. . . .	73,722.24	163,229.05
Nov. . . .	130,344.28	191,883.01
Dec. . . .	113,298.19	134,451.07

\$567,331.25 \$958,125.63

The following summary shows the different sources of revenue from timber for the past two months:

Timber licenses — Nov., \$155,289.66; Dec., \$224,871.

Timber royalty—Nov., \$25,127.40; Dec., \$5,015.02.

Cordwood royalty — Nov., \$206,31; Dec., \$84.

Scaling fees — Nov., \$1,607.99; Dec., \$1,863.16.

Timber leases (rental) — Nov., \$8,675.65; Dec., \$2,039.90.

Timber license transfers—Nov., \$716; Dec., \$498.

Handloggers' licenses — Nov., \$260; Dec., \$80.

The aggregate sale of lumber for British Columbia during 1907 is estimated at 495,065,223 feet.

LUMBER EXPORTS FROM PACIFIC COAST.

During the year 1907 Washington shipped 1,092,849,022 feet of lumber, swelling the total lumber shipment from British Columbia, Washington, Oregon and California to 1,510,290,122 feet. With the exception of 1906, last year's business in the lumber trade was the most successful. The San Francisco earthquake disaster occurred in 1906 and the demand for lumber in the California city swelled the totals for that year. While the actual figures show a decrease in 1907 of about 57,500,000 feet in shipments over the year of 1906, the total for the year of 1,510,290,122 represents an increase of 400,000,000 feet for the normal year immediately preceding the San Francisco disaster.

Australian trade increased 5,212,975 feet; Chile, Peru and Mexico increased lumber imports from the Pacific coast by 45,000,000 feet, while shipments to England gained 10,000,000 feet. The total gain for the foreign trade was 17,509,800 feet. The big gains were partially offset by losses in China, Japan, South Africa, Europe and South America.

The mills of Washington suffered the least by the fall-off of trade, notwithstanding the fact that they suffered a domestic loss of 49,120,943 feet. Oregon mills showed a net domestic loss of 25,044,442 feet, and a foreign loss of 11,875,266. British Columbia shipments show a decrease of 12,781,144 feet.

AGAINST EXTENSION OF TIMBER LICENSES.

At the tenth annual convention of the Associated Boards of Trade of Southeastern British Columbia, held at Moyie, an attempt to bring in a resolution to double the twenty-one year term of timber licenses was defeated. The opinion was expressed that no further legislation should be enacted until such time as the nature and extent of the forest reserves were accurately established.

A resolution was passed asking that the Provincial Government should immediately survey all available horticultural lands and should not sell except to bona-fide settlers. It has been announced by

Hon. W. J. Bowser, Attorney-General of British Columbia, that a survey of all Crown lands will shortly be made.

SUIT OVER TIMBER COMPANY

Alleging that the value of certain timber limits on Yeo Island, Georgian Bay, recently operated by the North Bruce Timber Company, were incorrectly valued when that company was formed, Messrs. Edward S. Piper, Henry Morgan, Geo. Burry, Archibald Speeds, all of Toronto, and Arthur D. Chisholm of Oakville, each of whom took \$12,000 in shares in the company, have brought action in the Non-Jury Assize, this city, to obtain the return of their money from Mr. Wm. Thompson, a mill owner of Chepstow, Bruce county, who was interested in the formation of the company. They say the limits were represented to them as being worth \$58,000, whereas they allege they were purchased for a sum of \$14,000, and a recent valuation disclosed that they are not worth more than \$10,000. The company recently went into liquidation. The defendant denied any fraud in the matter. Chief Justice Mabee is hearing the case.

B.C. LOG SCALER'S STATISTICS FOR 1908.

The grand total of logs scaled on the British Columbia coast during the year 1907 reaches 407,065,223 feet, the average scaling per month being 33,922,102 feet. The greatest measurement of logs scaled in one month of the year passed through the hands of Mr. Andrew Haslam, supervisor of log scalers, in July, when no less than 47,764,544 feet were measured by the Provincial Government officials. In January of last year there were scaled over 13,000,000 feet. For January, 1908, the total will probably reach 20,000,000 feet.

Current Trade Conditions

ONTARIO.

The latest estimates of the pine cut for the season received by the Department of Lands, Forests and Mines of the Ontario Legislature show a shrinkage of 35,000,000 feet. The estimate made earlier in the season was 710,000,000 feet, but this now has been reduced to 675,000,000 feet. With regard to railroad ties the estimates have been changed in a diametrically opposite manner. The Canadian Northern, the National Transcontinental and the Canadian Pacific Railways are all drawing upon Ontario now for their supply of ties, with the result that the estimated output has doubled. It is expected that 5,000,000 ties will be required of this province. The estimated cut of pulpwood is 216,000 cords.

During the past week or ten days sufficient snow has arrived to guarantee sleighing for the balance of the winter. In the woods a lighter fall would have been more welcome, particularly in view of the present thaw which, if prolonged and followed by more cold weather, may prove troublesome for skidding and hauling operations in the bush. As it is, work in the woods has been generally retarded. The smaller operators are more likely to feel the effect of this since they are anxious to work to the best advantage this season, in view of the unusual expense under which they are compelled to operate. They are taking out less than last year in the most instances, but as they keep cut up closely each season they feel constrained to make the best possible use of their time. The larger operators in many cases are not cut up so closely.

Although buying continues dull, there is a fair amount of business being transacted. Hemlock is fairly active and shows every indication of assuming somewhat of its old time vigor very shortly. Everything depends upon the amount of building that will be undertaken

during the early summer and as yet it is difficult to more than surmise what this will be. The falling off of American and British orders gives the general trade of Ontario a leaner appearance than it would otherwise wear, a condition which will probably not right itself very readily.

White pine is in fair demand, inquiries being more numerous than sales. Spruce is holding its own well. We understand that orders for eastern spruce are being picked up in greater volume in Ontario than the general trade would lead one to think. Hardwoods are featureless. Prices are stationary, but orders are few.

EASTERN CANADA.

Lumbermen, it is said, have about finished cutting on the Restigouche for the season, the cut amounting to between fifty and sixty million feet. Owing to the continued fine weather a little more was cut in that district than had been calculated upon. On the whole, however, the reduction in the general cut is being pretty well adhered to. Lumbermen who have planned carrying on their business this winter will welcome the recent snowstorms. In some sections considerable lumber has been cut and is lying in the forests. Teams are already at work hauling out this lumber, despite the continuance of storms.

No great awakening in demand is as yet in evidence, but prices are uniform and prospects point to a revival of trade in the spring. Shingle are in moderate demand with prices well maintained. Cedar extras are quoted at \$4.10 to \$4.20, and clears at \$3.60 to \$3.70. Offerings of the most desirable shingles are not large, and retail yards are not by any means overstocked. Lath vary in price. In most centres the production has been very much less than a year ago, and an advance is shortly looked for.

WESTERN CANADA.

The recently announced drop in the prices of lumber on the coast comes as the climax to a long period of uncertainty that has spelt slump for many weeks past. Rough lumber has dropped from \$2.50 to \$3 per thousand, clear \$2 and shingles 25 cents. What this will mean to the coast manufacturers only time can tell. The situation was undoubtedly forced by the banks clamoring for the reduction of overdrafts and insisting that stocks be reduced. The uncertainty also regarding the extent of next summer's operations and the fear that little lumber would be required has also conduced to bring about a drop in price.

Throughout the entire West the uncertainty regarding the lumber situation is marked and only a pronounced return of building activity can restore confidence. That preparations are already being made in many centres for spring building is becoming daily more noticeable in spite of the weakness of the lumber market. Silent mills are everywhere in evidence, and in many districts the log cut will not be more than 20 per cent. of that of last winter. To quote the words of one large dealer: "If the market were to open up as usual, in two months there would be scarcely a board in stock and it would be a considerable time before the new stock could be got in condition for shipment."

UNITED STATES.

Almost all the buying of white pine in the Chicago market is said to come from factories needing material for immediate use. Inquiries are numerous enough, but fail to result in orders. The country yard trade is extremely quiet. In hemlock an improved demand is noticeable, particularly for heavy construction timbers. Inquiries are coming in again regularly and the probability is that as soon as building operations become more active the demand for hemlock will be close to normal. At Buffalo all prices are said to be strong with a promise of remaining so until business revives again.

The hardwood trade continues

extremely light, factories alone keeping up the demand. Car building companies are carrying over heavy stocks from last year and need to order for special requirements only. At Buffalo there is no hardwood really off in price, though trade is very slow.

Shingles in the Chicago market are in but small demand. Red cedars are quoted at \$3.73 for clears and \$3.31 for stars. The Washington mills will not re-open until March 1.

GREAT BRITAIN.

There is still a decided lack of animation in the lumber trade, nevertheless stocks of spruce are being slowly but surely diminished in Liverpool and Manchester. The Canadian pine deal market keeps firm and will continue to do so, as supplies in the Ottawa valley will be well looked after during the coming season at tip top prices.

It seems difficult for the English buyer to realise that the cut is being so generally curtailed in Canada, but he will probably be more open to conviction during the coming summer when the real effects of the curtailment are more noticeable.

THE ENGLISH SPRUCE MARKET.

The opinion of British importers of Canadian spruce regarding the present position of that wood is rather frankly expressed in a communication to "The Timber Trades Journal," which is as follows:

"I have been greatly puzzled of late, in reading your remarks on 'The Position of the Spruce Market,' to account for the optimistic way in which you regard the future of prices of spruce. I can see no grounds for such optimism. Liverpool and Manchester having this year swallowed an enormous quantity of stuff are now very badly in need of a time for digestion and assimilation, and even should they get that, the lassitude consequent on a very full meal has to be taken into account. The Glasgow and Bristol Channel markets are quite indifferent about any further supplies for some time, and the Clyde has to face shipbuilding depression. Ireland, from Derry to Cork, is overstocked, Belfast especially so. The United States are certain not to be anxious buyers for some time to come, and it is admitted that shippers in Canada have very large stocks cut for the United States market lying on their hands, which will require absorbing before the new cut can be disposed of. Anyone with even a limited knowledge of the spruce trade knows how valueless are shippers' usual spring reports of idle mills, empty rivers and snowless winters, and that it is quite certain there will be something about the usual quantity to be disposed of this year. Yet in face of extreme sluggishness of market conditions on both this and the American side, we are told spruce is sure to go dearer, and shippers are trying to establish prices for this spring on a basis very nearly approaching those of 1907, when trade was certainly much brighter, and stocks on both

sides of the Atlantic less. It seems that the danger to importers here is that shippers may be strong enough to establish high prices for the first spring cargoes, and are very unlikely to be able to keep these prices for later shipments, when we shall be treated to a slump, and left to realise our early stuff as best we may. I am open to conviction, but it seems to me the spruce market is in a very unstable condition, and I am not a bit optimistic.

"Yours Sincerely,

"HIBERNIAN."

"January 21st, 1908."

LAURENTIDE PAPER COMPANY.

Directors of the Laurentide Pulp & Paper Company, Quebec, of which Sir William Van Horne is president, have declared a semi-annual dividend of 3 1-2 per cent., placing the stock on a 7 per cent. per annum basis, an increase of 1 per cent. For the fiscal year ending June 30, 1907, after the payment of dividends on both preferred and common stock and the addition of \$20,000 to depreciation reserve, a balance of \$83,321 was carried forward.

The mills of this company are situated at Grand Mere, Quebec, on the St. Maurice river, and get their motive energy from a water power situated at that point. In addition to this water power — which is amply sufficient for the present needs of the company, being capable of developing 20,000 horsepower — the company hold in reserve another one of equal capacity in the immediate neighborhood.

The company own 1,800 square miles of timber limits, situated in close proximity to the mills on both sides of the St. Maurice river. As a result of their location the logs can be readily delivered at the mill by water.

Mills at Greenbush, Sask.

THE NEWS

Larose & Berthiaume, sash and door manufacturers, Montreal, Que., are reported to have dissolved.

La Compagnie Manufacturiere du Village de D'Israeli, are the latest addition to the ranks of the Quebec lumber manufacturers.

A new lumber company, Copping Brothers, have registered at Boscobel, Que. The members of the concern are Norman, W. C., and J. W. F. Copping.

Another lumber yard is to be established at Caron, Sask., within the next two months, when the Stees property will be covered with forty carloads to start with. Mr. Stees, the promoter of the enterprise, is now at Fernie, the mill headquarters, where 5,000,000 feet are already cut.

D. Pottinger, general manager, Intercolonial Railway, Moncton, N.B., invites tenders up to February 18th for the construction of a hard pine trestle bridge at Sydney, N.S. Plans and specifications may be seen at office of chief engineer, Moncton, N.B., and at the station master's office, Sydney.

Ed. Robertson, foreman in one of Laking's camps, at Haliburton, Ont., met with an extremely painful accident a short time ago, his hand being badly crushed while he was helping to load some logs. We are pleased to hear that he is making good progress towards recovery.

The British Columbia Gazette contains notice of the incorporation of the Proctor Lumber Company, Limited, capitalized at \$250,000, the Bayard Timber Company, Limited, capitalized at the same amount, and the Queen Charlotte Lumber and Manufacturing Company, Limited, capitalized at \$150,000.

The Empire Lumber Company were the principal losers in a disastrous fire at Latchford, Ont., which wrought damage to the extent of \$100,000. The fire originated in the King Edward Hotel and spread to other buildings, destroying in its course the Empire firm's large store and the timber in stock, together valued at \$50,000. We understand that this loss is fully covered by insurance.

M. L. Foley, inspector of ties for the G. T. P., returned to Victoria recently after a visit to Alberni. He was most enthusiastic upon the subject of Vancouver Island timber. He was looking up mill sites for a company which purpose erecting a number of mills on the island in the near future. He traveled over the projected E. & N. right of way as far as Cameron lake. The road will travel through millions of feet of virgin forest. In all probability this timber will be watered by rail at Alberni and Nanoose Bay.

The steamer Georgia, of the Canadian-Mexican line, had the distinction, as far as can be learned, of being the first large steamer to load at the port of Sidney, B.C., where she took on 350,000 feet of lumber from the Carlin mills at that place for Mexican ports. The lumber, which was loaded by McCabe & Hamilton, was put on board from scows in the lee of the islands, and the Georgia then proceeded to Victoria to take on board some general freight at the outer dock. At Vancouver, New Westminster, Ladysmith and Comox the steamer loaded cargoes and then proceeded to Salina Cruz.

An interesting case was settled at St. Paul, Minn., last week, when the Supreme Court found for the State in its suit against the Rat Portage Lumber Company to compel payment for state timber removed after the legal cutting limit. The principal plea advanced by the company for its failure to get the timber off the ground in time was its inability because of the elements. This the court partly admitted, but said that it was no excuse. The contention that the statute of limitations acted as a bar to the recovery by the state was denied by the court, which held that a person to whom a permit had been issued has a right to cut and remove timber only during the life of the permit; that after the expiration of the term of the permit, the logs cut but not removed were the property of the state, and the defendant having no right to remove this property was guilty in so doing.

B. C. LOGGERS IN ANNUAL SESSION.

The British Columbia Loggers' Association, Incorporated, held their annual meeting on January 13th last, with a representative attendance of members.

The first business transacted was the election of officers, which resulted as follows:—President, W. I. Paterson; Vice-President, J. A. Tomlinson; Secretary-Treasurer, J. MacQuillan; Directors, D. J. O'Brien, Gulf Lumber Company, Limited; Captain Theodore Magnesen; G. A. MacKinnon, Norton & MacKinnon; L. L. Dickerman, Columbia Lumber Company, Limited; George E. Davenport, Jervis Inlet Lumber Company, Limited; John Heaps, The Heaps Lumber Company, Limited; William Norton, Norton & MacKinnon; W. C. Kiltz, The Kiltz Logging Company, Limited; T. F. Paterson, The Paterson Lumber Company, Limited and Herbert Gilley.

Logging generally and its allied interests were discussed at considerable length, the consensus of apparent opinion being that the prospects of the industry and the timber situation at large were good, and that while there was always room for improvement in methods and so forth, the tendency all round was toward steady improvement. Speeches were made by Mr. John O'Brien, of the John O'Brien Logging Company, of Sechelt; Mr. W. C. Kiltz, of the Kiltz Logging Company, Limited; Dr. Davenport, of the Jervis Inlet Lumber Company, and others. All spoke in favorable tones of the future, and of the considerable influence for good in the development of the Province's timber resources that lay with the Association.

TO PROTECT FORESTS AND GAME.

There has been founded in St. John, N.B., a branch of the New Brunswick Fish, Forest and Game Protection Association, with F. H. Flewelling, president, Frank Rankine, vice-president, and D. C. Clinch, secretary-treasurer. T. H. Estabrooks is one of the board of directors. This association was started last year in Fredericton, and promises to become a valuable institution for the purpose indicated in its title.

WHOLESALE DEALERS IN

COAST LUMBER and SHINGLES - TIMBER LANDS

1908 ?

YES, we are optimists and have the utmost confidence in 1908. We have increased our facilities for supplying "QUALITY" SPRUCE of superior grade and the finest possible mill work. We are now in position to take care of either straight car business for FLOORING, CEILING, PARTITION, NOVELTY SIDING, NEW BRUNSWICK CEDAR SHINGLES, LATH, etc., or thoroughly mixed cars of the above. Our facilities for this business are unequaled anywhere. If you wish small quantities of various varieties we can serve you as well as on straight car shipments.

We have built up our trade to its present large volume through uniformly fair treatment of customers and close attention to the quality of our products. We believe that "Quality is the best policy." Our customers believe it also. It means to them satisfied trade, larger profits, increased business, and the satisfaction of always handling the best of its kind. The time when any old thing would do has passed. Now people want things right. They feel with us that "Quality is the best policy." If you do not know the meaning of "FENDERSON QUALITY" you will do yourself a favor by trying "Quality Policy" and Stock.

RESAWING MACHINE

As can be seen by the engrav-
ing, the frame is cast in one
piece. The legs of cast iron are
cast in one piece with the saw
bench. This makes an extreme-
ly substantial machine.

The feed rolls 12" diameter are
driven by cut gears 16" in di-
ameter. The proportions of the
gears are such as to give a
powerful driving mechanism.

The arrangement to set the
stationary roll (not shown in the
cut) is very accurate, quick and
reliable. The clear distance
between the slides is 19".

The steam press is of im-
proved construction and has a
travel of 10".

The saw is 42" and saw arbor
bearing is set in slide so that
saw can be brought closer to the
rolls, as it wears.

The weight of the machine is
3,000 lbs.

50 TEMPERANCE STREET

THE "TOWER" LINE OF EDGERS

Note the following important features

1. The vital parts are carried by a substantial iron husk, resting firmly on the floor.
2. The arbor runs in three long bearings, the main pulley being between two of them.
3. The saws may be removed without disturbing the arbor, the whole operation being the acme of simplicity.
4. The adjustable guide is wonderfully simple and always works perfectly.
5. The index for setting the saws and holding them in place is adjustable, so that the boards may be cut scant, exact or plump, as may be desired.
6. The figures indicating the position of the saws are at the front end of the front table, and consequently close to the operator. This is especially important on dark days, or when the edger stands in a dark part of the mill.
7. The front pressure roll swings away from the operator, and so requires no lever to raise it, and prevents the lumber from "kicking" back, by reason of the tendency of the roll to bind when the board travels in the reverse direction. This construction further makes it feasible to use a smaller roll, which does not hide the saws as much as a larger roll would.
8. The manner of shifting the saws is in accord with the most modern and approved practice.
9. All parts are made to template and are therefore exactly alike. They are also lettered. Thus duplicate parts that will fit perfectly may be readily obtained.

Iron Frame "Simplex" Shingle Machine

IN this, our latest design of Shingle Machine, we have incorporated all the advantages contained in our wood frame "Simplex" and added several improvements.

The arbor has been made heavier and a third bearing added to support it outside the driving pulley. The method of putting lead in the saw arbor has been greatly improved. This is now done by swinging on a centre directly under the saw the whole frame which carries the arbor. Thus the alignment of the bearings is not in any way affected and there will be no danger of hot bearings after the lead has been changed. The change may be made while the machine is running and without stopping the carriage.

An improvement has also been made in the method of driving the edger. It is belted direct from a shaft running at right angles to the main arbor from which it is driven by means of a bevel friction. This makes a very neat compact drive and has proved satisfactory in the mill.

The rail on which the carriage travels is made of square steel and when worn can be renewed by simply turning upside down.

Over three hundred of our Upright Machines (wood and iron frames) are in use in British Columbia and Washington.

The Celebrated

'TOWER' one-man 2-Saw Trimmer

The simplest and easiest Trimmer to operate on the market. It will do more work in a given time than any other machine of its class made, and that with less fatigue to the operator.

The manner of adjusting the saws
SAVES TIME, STEPS AND LUMBER

The following are a few of its advantages:

First and foremost is the manner of shifting the saws. With other trimmers, every time the saws are moved, it is necessary to go to the end of the machine.

With this trimmer, it is never necessary to go beyond the end of the board. This means a great saving of steps and time, especially with short boards, and a corresponding increase in the quantity of work done.

It is also much easier to see how to trim the lumber to the best advantage from the end of the board than from the end of the machine.

THE "TOWER" ONE-MAN TWO-SAW TRIMMER
thus

SAVES LUMBER BY REDUCING WASTE

And the operator can not only trim the lumber to better advantage, but he can see how to do it at a glance, and can thus adjust the saws in less time, resulting in a still further increase in capacity.

Second. Two feeds are provided—one for thick lumber, the other for thin. When the lever that controls the feed works occupies a central position the feed stops; when it is thrown to the right, you have the fast feed; to the left, the slow feed. The lever is so located as to be as convenient as possible for the operator. The feed may be started, stopped or changed while the saws are running.

Third. The facilities for taking off the saws are unsurpassed. The bridge-trees at the ends of the machine, each of which is secured by two stud-bolts, are removed, and the saws are ready to be slipped off.

That the 'Tower' One-man 2-saw Trimmer possesses merit of no common order is strikingly demonstrated by the fact that there are

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOOD-WORKER is published in the interest of and reaches regularly persons engaged in the lumber, wood-working and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN AND WOOD-WORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — MARCH 1, 1908 — MONTREAL

"All Right, So Far!"

Once upon a time an Irishman fell from the roof of a twenty-storey building and rapidly headed downward. His native cheerfulness and hopefulness did not desert him, and as he passed each floor he was heard to shout, "All right, so far!"

While chapter and verse can not be quoted for the above, a very good lesson might be learned from the moral it contains—confidence in the present, disregard of the future. It is lack of that very confidence that has begotten so much of the trade lethargy which has served to depress the welfare of this country and the republic to the south of us. So long as the day was unclouded all went merrily. Speculators vied with one another in more or less foolhardy ventures. Business men thought only of expansion. The nation was vital with business energy. Enterprises came into being in a day and before the ink was dry upon the stockholders' parchment dividends were trebled and fortunes made. Year after year of abundant crops in the west, with magnetic power, drew men from Ontario and the east and thousands of acres of prairie were dotted with homesteads and the camp fires of civilization curled into the blue sky of the "last west." All was going merrily.

Last spring frost lingered late in the wheat fields. The grain grew slowly through weeks of dreary weather and was nipped by recurring frosts. "A total crop failure in the west!" some one cried. The newspapers caught up the refrain. From coast to coast a famine was heralded as the next of evils. Statistics were compiled and published, showing the enormous inevitable decrease in the wheat yield of 1907. Western business was saturated with anticipation of trouble and the entire country stopped its work to watch. Not even when the crop situation was assured did confidence return. The banks curtailed credit. Purchasing stopped, gradually at first, then almost completely. By November the hard times cry was heard in the land and by December trade was, comparatively speaking, at a standstill.

That the depression has been caused by a mere passing spasm of fear has been demonstrated amply by the suddenness with which trade is reviving. All over the country the "All right, so far!" is becoming audible, and soon we shall have "boom" times again. Even in Winnipeg the "city of cold feet," there is returning confidence. To quote the "Free Press" of that city of February 17:

"A remarkable stimulus to retail business was noted by many Win-

nipeg merchants on Saturday. It is claimed that it was one of the heaviest days for a year, and one merchant stated that the indications pointed to very active trade for the remainder of the winter."

It is now up to the railways and corporations to do their share toward restoring confidence. At a recent council meeting of the Canadian Manufacturers' Association it was stated that the railways had ceased building cars and the Railway Committee was instructed to point out to the Railway Commission that the result would be a serious shortage in cars this fall, inasmuch as indications pointed to an early and brisk revival in trade. Such statements are not made at haphazard. At the same meeting Edward Gurney predicted that 1909 would be the biggest year Canada has yet seen, and Edward Gurney's opinion is held by every live business man in Canada to-day. A display of confidence during the next few weeks will do marvels in loosening the sinews of trade and dispelling the fear that is at the bottom of the present trade inactivity.

Money Easier—Trade Brighter.

The accumulation of money in the banks of the larger cities and the consequent easing tendency of the money market are going far toward making collections easier than they were, a state of things that is helping toward a revival in the general lumber trade. Though the demand for mill products is still considerably below normal for this month there has been a degree of increase that if continued augurs well for the future. More favorable conditions in the money market and easier collections in general have had their effect in enabling mill operators and wholesale dealers to recover the ground lost in the matter of credit during November and December and reinforcing their position in the business world. This is certainly encouraging, and it is generally felt that as the season advances operators and the trade at large will be able to take care of the future without further embarrassment.

Scarcely anyone expects that demand will swell to full volume this year. It takes time for recovery from a setback, however slight. Moreover, in the present instance there will be a lessened requirement for railroad and carbuilding material, less call from the large corporations consuming timber and lumber, and a more conservative attitude on the part of everyone. January and February, in years of normal activity in the wood consuming industries, are the months in which large consumers and wholesalers make contracts for their year's supplies. Such contracts are depended on by the large mills as the basis of their operations for months. This year, however, there has been a notable absence of large contracts, the principal demand, such as it is, being for yard stock, mostly in small and moderate sized orders for immediate delivery, with a considerable selling to industrial consumers, also in small and moderate sized orders and for immediate or early delivery. To use a much-worn phrase, it is a "hand-to-mouth" trade.

Three influences are contributing to this kind of buying. One is the evident determination of consumers to move forward cautiously by buying lumber only as they need it; another, the existing doubt as to the extent of demand throughout the year and its effect on prices; the third, a recognition of the fact that there being plenty of cars and a light traffic on the railroads, lumber can be delivered when wanted. All these conditions, while they continue to exist, will preclude the placing of large contracts for delivery over a prolonged period.

The fact that the demand has steadily increased since the beginning of the year, with a particularly noticeable improvement during February, shows that such a thing as complete stagnation in the lumber trade of this country is not possible. The demand will begin in earnest with the spring building trade, but it will for a time be confined to actual wants and will be for immediate delivery. The farmers' trade will be more than usually important in the year's demand on account of the lessened call for stock from the larger corporations. Later in the season the railroads will again be in the market and by the autumn months the trade will show all its old-time vigor.

It is said that there are some dealers who are selling more lumber than they care to tell about. Perhaps it is because they are ashamed of the prices they are asking.

More Building Means Cheaper Money.

Throughout the entire country there was no great reason for self-congratulation regarding the returns for new building in January. Nevertheless, the exhibit is not so bad as it might appear, and at the present moment there is much more work coming into view than is indicated by the current run of building permits. Many investors who shrank from putting money into real estate improvements by reason of the high prices of labor and materials prior to the recent period of depression are now investigating the situation with a view to presently embarking on their undertakings. A constantly increasing amount of estimating and figuring is being done, and from all accounts a very considerable amount of work is going to be in hand with the coming of spring. Particularly in the West is the opening up of building activity noticeable. In Calgary at the present time there is work under construction to the value of over \$900,000. Prince Albert and Vancouver are almost equally notable examples, and all over the Dominion there is an awakening interest in structural undertakings that bodes well for the future.

Money must become cheaper, however, and until it can be had for real estate investments at 6 per cent. and under there is reason to expect that speculative building will be detrimentally affected. That rate will be reached before many months, in all likelihood, and perhaps even sooner than is generally expected.

Less Capital for Luxury.

The restoration of confidence in the banks, and the free circulation once more of the country's currency, have given a wholly different aspect to the economic conditions from that which was prevalent in November and December. The money stringency stopped the movement of wheat, corn and cotton from the farmers to markets. It stopped the wheels of factories everywhere. It closed many mines, brought building operations to a standstill, and threw hundreds of thousands of men out of work. It crowded the steerage of east-bound steamers with scores of thousands of workmen who chose to return with their savings to their native lands until the demand for labor should call them back here again. But the country is fundamentally prosperous, and in most sections there is evident a gradual resumption of activity and a great deal of confidence as respects the future. Quite apart from the transient currency panic, there has set in a widespread process of what is called liquidation. Loans have been called in and credits are undergoing readjustment upon a hard-time basis. * * * It will be a period for the practice of thrift and the homely economic virtues, in order that resources, both private and public, may be used for the best possible results. There will be a very sharp reduction in luxurious expenditure and a corresponding increase in the amount of new capital that can be devoted to business undertakings.—From "The Progress of the World," in the "American Review of Reviews" for February.

One Way of Getting an Order.

The "Edinburgh Scotsman" tells a story about a commercial traveller (probably a lumber salesman) who recently resorted to an ingenious device to capture an order. It seems that for some time he had been making untiring efforts to "get his foot in" with a certain provincial tradesman whose orders are extensive and frequent. Time after time he called, but without success.

At last, one day as he entered the shop he found a big, loutish fellow engaged in a heated altercation with the proprietor. The commercial stood back and waited for the trouble to blow over, but instead it rapidly increased. When the lout was threatening the storekeeper with a "punch on 'is 'ead," the traveller interfered, and adroitly brought the stream of personalities to bear upon himself. Then there was a row and a scuffle, the lout was landed in the gutter, and in the glow of victory an order was asked for and obtained.

Business relations have been maintained to this day, but it is doubtful if this would be the case if the tradesman knew that the plucky contest, which ended in the "chucking out" of his persecutor, was a "put up" job, and merely a business ruse on the part of the traveller.

Green Spruce Does not Make Good Flooring.

In reply to the question raised in our issue of February 15 as to the advisability of manufacturing green spruce into flooring, siding, etc., answers have been received from two authorities on the subject as follows:

Ottawa, Can., February 24, 1908.

Editor, CANADA LUMBERMAN,

Toronto, Ont.

Dear Sir,—Referring to the query in your issue of the 15th inst., "Does green spruce make good flooring?" I would unhesitatingly say that no green lumber, or for that matter no lumber that is not bone dry, makes good flooring, clapboards, etc. I think one of the chief objections of the carpenters would be in matching, as no doubt from the time the logs were sawn into lumber and matched for flooring, some portion of the stock would have had a better chance to dry out, and consequently it would not all shrink the same amount, and of course there would be no end of trouble matching it together.

Another objection would be in discoloring. I find that spruce, dressed and matched, to be stored in our sheds has to be perfectly dry, otherwise it blackens on the dressed face, although take the same lumber in the rough and it could remain stocked down for years, providing you keep it free from rain and dampness, and it would turn out as white as when it was first sawn.

Another objection would be the twisting, that is if it was put down for a floor where there was any chance of it drying out quickly, I don't think it could be nailed so that it would stop in place.

Hoping this may be of benefit to some manufacturer, I remain,

Yours truly,

R. G. DINSMORE.

Deseronto, February 24, 1908.

Editor CANADA LUMBERMAN.

Dear Sir,—Replying to query of "Lumber Manufacturer" in your last issue as to whether satisfactory results can be had in making spruce green from the saw into flooring, siding, etc., I should say decidedly not. In the first place, it is almost impossible to make a good job of matching and dressing spruce green from the saw; in the second place, if put into a building in that condition, it will shrink five per cent or more; a piece four inches wide will shrink from one-quarter to one-half inch during the process of seasoning; and if matched while green and allowed to season before being used, it will not go together properly. If it were hemlock that was referred to my answer would be a little different.

Yours truly,

JNO. MCGREGOR.

Annual Meeting Canadian Forestry Association.

The annual meeting of the Canadian Forestry Association will be held in Montreal on the 12th and 13th inst., and the prospects are good for a most interesting and well attended convention. Some of the contributors to the program are: Monsignor J. U. K. Laflamme, Dean of the Faculty of Arts, Laval University, Quebec, "How Some Farmers Use the Wood on Their Lands"; E. G. Joly de Lotbiniere, Quebec, "Compulsory Timber Reserves on Settlers' Lands"; A. H. D. Ross, Lecturer on Forestry at the University of Toronto, "The Dominion Forest Survey," and C. G. Piche, Forester of the Province of Quebec, "Forestry in the Province of Quebec."

As a large number using the French language are interested in this meeting some of the papers and proceedings will be in that language.

On one of the evenings of the meeting an illustrated lecture will be given by Professor Filibert Roth, of the Faculty of Forestry of the University of Michigan. Professor Roth is one of the best known foresters on the American continent, and is well equipped for the lecture platform.

A PESSIMIST

is a man who turns out the light to see how dark it is.

Lumber to The Front.

As an old time lumberman it is quite interesting to me to note the increasing interest which the general public has in lumber and lumber conditions, writes Jesse D. Crary, editor of the "Lumber Trade Journal." Although this has been one of the great industries of the country ever since it was discovered, yet it is probable that it has attracted less attention than any other of importance.

In times of great public concern the daily press has always given the opinion of Mr. So-and-so, banker, Mr. So-and-so, the drygoods king, and others, but, for some reason or other, the opinion of the lumberman has never been thought worth recording. We read among the list of passengers bound for Europe, Mr. Smith, the banker, Mr. Jones, the drygoods man, Mr. Robinson, the hardware merchant, and a lot of others. Among the "others" you would find the lumbermen.

In literature, until very recently, no one ever thought of marrying the rich lumberman's daughter to the hero, or the rich lumberman to the heroine. But all that is changing. The lumberman is getting to be in the public eye. And why? Simply because he is coming into his own. His importance in the commercial world is, at least, being recognized.

The lumber trade as a whole, at the present time, is bearing its proportionate part of the business depression, but is not worrying about it, because the trade can see nothing but good times ahead and good value for its stocks. The time for cheap lumber is gone forever, and I have no

That Export Duty on Pulpwood.

At a meeting of the Quebec Board of Trade, held in that city on January 31st last, the question of the proposed export duty on pulp wood came up for discussion. Mr. J. F. Guay gave a brief resume of his arguments in support of a duty. He thought that the imposition of such a duty would result in the preservation to Canada of one of its chief assets. He mentioned the fact that United States parties now controlled one-seventh of the limits territory in the Province of Quebec, and said that the duty might have for effect the manufacture of the pulp now exported into its eventual product in the Dominion.

Mr. H. M. Price, in reply to Mr. Guay, said that the only thing he was sorry for was that the Americans did not own more than one-seventh of the timber limits of the Province, as it would be all for the good of the country. There was a great deal of misconception in regard to the pulp question. Taking the lands available in this Province into consideration, there was sufficient to supply the United States, at the present rate, for 500 years to come. Then the reforestation of the area cut down was very rapid. The supply was practically inexhaustible. If would be a minus policy to put such an export duty into operation, and no one would suffer more than the habitant. Further, according to statistics, Canada had increased at a much greater rate than the United States, in the manufacture of pulp and paper. The consumption of pulp wood was only four per cent. of the total consumption of wood in the United States. It was wiser, he thought to consider that the future

Sturgeon Lake Lumber Company's Ice Road Lumber Train.

hesitation in saying that I believe that the present prices are as low for lumber as they ever will be in this country. This prediction is grounded on the firmest sort of foundation.

The lumberman stands unique in the business world. He realizes that to-day he is cutting his only crop. No living lumberman will ever reap the crop which is sown now. He is living on his capital, and is bound that, this being true, he will get a fair margin of return or else he will keep his capital intact. In other words, the lumbermen, as a class, have got beyond the point where they must sacrifice their timber. This has not always been so. Millions and millions of feet of lumber have been sold in this country, where a lumberman did not get as much for an acre of stumpage, as many of us spend for a cigar.

To-day he is going to get his price or he will close his mill. It needs no concerted action, no trust or combination, to make him do this. He realizes that he has in his stumpage something which is growing more valuable every single day.

Hog Raising a Side Issue.

Hog raising as a side issue to the manufacture of paper is an experiment which the Great Northern Paper Company is to try. The first consignment of hogs will be turned loose on an island in a Northern Maine lake, and the animals will be allowed to run wild, feeding on the roots, forest vegetation and nuts.

of Canada was assured and be satisfied to proceed slowly, but surely.

Messrs. A. G. Auger and P. Paradis also spoke on the same lines, the latter in particular, going fully into the subject and quoting figures in profusion to prove a misfortune, not alone in Canada, but for the Province of Quebec in particular. He intimated that a Royal Commission was to be appointed to study the whole question.

The Northern Express.

Every day at noon there pulls into Prince Albert, Sask., the Northern express with 160,000 feet of lumber and 7,000 feet of lath. This engine is built for running on ice roads and the lumber is loaded on large sleighs which run in ice grooves prepared at considerable trouble. So far the Sturgeon Lake Lumber Company have brought in about three million feet of lumber from their mill, 32 miles north of Prince Albert. The Northern express is the only railroad engine of its kind in Canada, and is being examined with much interest by western lumbermen.

Saw Mill For Sale.

Tenders will be received by the assignee, J. D. Hall, up to March 10 for the purchase of the new Telford saw mill at False Creek, Vancouver. The mill is said to be very favorably situated and has a capacity of 40,000 feet per day.

Lumbermen's Association Meet

An event of considerable interest to the lumber trade is the annual gathering of the Lumbermen's Association of Ontario. When our lumber kings get together to discuss the protection of the forests from fire, car staking, reciprocal demurrage, inter-switching, etc., there is "something doing" every minute.

The meeting at the Queen's Hotel, Toronto, on the 27th ult., was preceded by the usual luncheon, at which Dr. Fernow, Dean of the Faculty of Forestry of Toronto University, was the distinguished guest. Hon. W. A. Charlton, the president of the Association, presided, the attendance including the following:

Hon. W. A. Charlton, J. & W. A. Charlton, Toronto; William Smith, J. B. Smith & Sons, Toronto; J. B. Miller, Parry Sound Lumber Company, Toronto; W. B. Tindall, Secretary Ontario Lumbermen's Association; W. B. MacLean, Conger Lumber Company, Toronto; R. Laidlaw, R. Laidlaw Lumber Company, Toronto; F. Burton, J. L. Burton & Son, Barrie; Dwight J. Turner, Turner Lumber Company, Toronto;

HON. W. A. CHARLTON,
President Lumbermen's Association of Ontario.

A. McCall, Simcoe; W. C. Laidlaw, R. Laidlaw Lumber Company, Toronto; C. J. Barclay, Brougham; Fred. Waldie, Victoria Harbor Lumber Company, Toronto; J. Playfair, Playfair & White, Midland; John Donogh, John Donogh Lumber Company, Toronto; Thos. Charlton, of J. & T. Charlton, North Tonawanda; A. E. Cates, Ontario Lumber Company, Toronto; Geo. Bruce, Ontario Lumber Company, Toronto; E. W. Rathbun, The Rathbun Company, Deseronto; J. M. Prentiss, J. & W. A. Charlton, Toronto; Dr. B. E. Fernow, Dean of Faculty of Forestry, Toronto University; John Walsh, manager transportation department, Canadian Manufacturers' Association; T. S. Young, CANADA LUMBERMAN, Toronto.

Letters of regret were read from Mr. Aubrey White, Deputy Minister of Crown Lands, and others.

When "The King" had been honored, Mr. Wm. Smith proposed the toast of "The Dominion and Ontario Parliaments," to which Col. Rathbun responded. He had few good words to say, however, for the Ontario Government's administration of Crown lands, and particularly in respect to the settlers' location policy. The Province of Quebec, in his opinion, was proceeding along the right lines. If a settler does not comply with the regulations, the lot reverts to the licensee.

Mr. W. B. MacLean proposed the toast of "The Faculty of Forestry, of Toronto University," to which Dr. Fernow responded in a very happy manner.

DR. FERNOW'S INTERESTING ADDRESS.

I did not know this was the way I was to earn my living—by a literary effort. I would rather sing a song, climb a tree or chop a tree than make an after-dinner speech. But I am very glad to have this opportunity of meeting you, as there is no one body of men in the Province of Ontario I am more anxious to meet, and not only to meet, but to know, than the lumbermen of Ontario. And to show this is not merely figure of speech, I can give you at least five good good reasons why it is only natural for me to wish such a thing. Firstly, for the same reason that brings you all together to-day. I, also, claim to be a lumberman, although there may be some here ready to argue that is not so. But I, too, have lumbered, not only in this country but in the old country as well. I want you to understand, although the public do not yet seem to appreciate it, that a forester, in addition to being a lumberman, is also something else, but first of all he is a lumberman. We are all of us in the business of supplying the public with forest or wood products. The forester is also in that business. The lumberman only seeks to supply the public from what the forest produces at the present time. The forester seeks to reproduce the crop as well. The difference may be more clearly brought to your realization in this way. The lumberman is a berry picker, who merely goes out and picks the berries, while the forester cares for the berries and also picks. This is one good reason why I wish to be associated with you.

Then, too, I am in the manufacturing business and interested in knowing the men who manufacture. Just now I am among the manufacturing lumbermen, and it is my special business to educate the lumbermen of the future. Do I hear some one sneering at the idea of my educating manufacturing lumbermen? There is some reason for sneering at the idea of trying to educate lumbermen in the woods or in the practical work of the woods, but while not impossible, it is sometimes difficult. Usually the men who sneer at the idea are those so-called practical lumbermen who do not seem to know that everything they do is based on a theory. The act of walking is based on the theory that when we take a step we will not fall. Many times these men are full of theory for which there is no basis. Lack of experience or lack of knowledge is a difficulty which can be outgrown, and I believe that men who have been taught systematically to observe conditions and to get education in a systematic way, are more likely to secure experience more rapidly in outgrowing these difficulties. I believe some things can be learned within academic halls that may be applied in the woods. Some men can go through the woods all their lives without observing facts under their very nose. I have heard old lumbermen remark that they had never observed that pine reproduced from seedlings. I tell them they have always been looking for logs and the tiny seeds on the ground have never appealed to them, did not make any impression on the grey matter of their brain. Then give our budding foresters a chance when they come out, allow them to go into your camps, not only to loaf around, but to learn how to lumber.

I want your good wishes. Receive these young men into your camps with their new fangled ideas and perhaps you can get some good from their new ideas, while they are learning much from you. I have worked for years to bring to perfection these ideas on forestry. One of the largest employing companies in the United States employ one of my students, give him a good salary and two assistants and started him with \$3,000 to work on, so they must think there is something in it. The Pennsylvania Railway have to buy ties, and on my advice have bought timber lands for a supply of ties and to preserve the young timber for a future supply of ties. A paper and pulp company, holding 300,000 acres, employed one of my students, rather doubtfully at first as to the wisdom of so doing, but that was ten years ago, so that we have experience. A concern, cutting about seventy million feet a year, employed one of my students, placed him in charge of camps cutting about twenty millions, but not by any means giving him carte blanche to do as he pleased. By his suggestions, and pointing out here and there where little wastes were made, in a cut of about sixteen million feet, they saved \$25,000, or 1 1-2 per cent. of the total cut was saved. How was this saving made? Simply by an inspection service. He also prepared a map for them and put it up in papier mache so that they could really see the hills, dales and rivers, and see the real location of each one of their camps, and plan for future cutting, etc. He could advise them where advisable to cut clean and leave nothing, and where to cut in a more conservative manner. Nothing new, but simply done in a systematic manner. This is what I want you to realize and see reasons for giving a chance to our young men when they come out.

I want your good will. I came here at the invitation of the University of Toronto to educate coming lumbermen, but it would be of no use to educate men to a profession that was not going to be put to practice. They have nothing to do with the coming generations, although they may be patriotic citizens. The Government is really the only one concerned, who has a real interest in a future timber supply, and now is the time to act. I am fairly familiar with the condition of your timber supply in Canada, and it is on its last legs if you will take history for it, and what you must do is to get the Government committed to a conservative policy.

The business of the annual meeting was then reached. The minutes of the last meeting and correspondence were read by the Secretary, Mr. W. B. Tindall, after which came the President's address, as follows:

PRESIDENT'S ADDRESS.

GENTLEMEN,—

Before proceeding to deal with business matters in which we are interested, allow me to refer to the death of one of our most prominent and distinguished members, a man who was respected and beloved by all who knew him, Mr. John Waldie, president of the Victoria Harbour Lumber Company. He died after a short illness in June last, and, on behalf of the members of this Association, your Secretary and myself sent a letter of sympathy to his bereaved family and, with other members of the Association, we attended the funeral at Burlington, where, far away from the

land where first he saw the light of day, his remains were laid in their last resting place.

Our last annual meeting was a year ago to-day. My predecessor, in addressing you, called attention to the advance in prices during the past few years caused by the greatly increased cost of everything used in the production of lumber, and he predicted that some classes of lumber would go still higher. The business of last year proved his conclusions to be correct. Prices have been high, and notwithstanding the very pinched condition of the money market which has prevailed in this and other countries for many months, the prices of lumber do not seem to be disturbed, except possibly in one or two lines. The unhealthy conditions of money matters would no doubt have affected prices but for other counteracting influences:

First.—The cost of production has not been reduced, notwithstanding that the price of labor came down about 15 per cent. in November last, about the middle of the log-cutting season. Hay and oats were much higher in price than usual and I think you will probably all agree with me that the cost of cutting and watering logs this winter is as high, if not higher, than ever before.

Second.—The stock of unsold lumber on hand at the mills and in all city and country yards is very very much less than for several years.

Third.—The quantity of lumber which will be produced this year is much less than last year, both in Canada and the United States. From reliable information as to the production of lumber last year, and estimates of quantities to be produced this year, my conclusions are as follows:

In Ontario—Pine and other lumber, 20 per cent. to 30 per cent. less this year than last, although railway ties will be more than double. Some localities will produce more hemlock than last year, but other places much less.

In Quebec and other Eastern Provinces, the production of spruce lumber, 50 per cent. to 70 per cent. less.

I have not been able to procure reliable information as to the probable quantity which the Western Provinces will produce this year.

In the Northern States.—Pine production, 30 per cent. less. Hemlock, 25 per cent. less.

In seven Southern States the reports from 266 mills shows the production of yellow pine 275 million feet less.

We all know that business during the winter months has been quiet and demand small, but there are signs of renewed activity in the lumber trade, and of easy conditions in the money market for legitimate business. I have learned of two contracts having been made this month for sale and delivery of this year's cut of lumber at prices equal to last year, and, for reasons I have given you, it is my opinion that last year's prices for nearly every class of lumber will be fully sustained. I have endeavored to give you my views upon the lumber supply and market in as condensed a form as possible and not to fill up this statement with a cart load of figures and quantities, but the conclusions arrived at are the result of careful calculations.

I will now direct your attention to a matter which, in my opinion, is of very great importance, not only to the lumbermen, but to every citizen of this province. I refer to the preservation of our forest wealth by protection from fire.

Up to about 1857 the North Hastings, Muskoka, Parry Sound and Haliburton country was a beautiful green forest. Now there is not one township in ten not wholly or partly burnt.

In 1857 the surveyors, running a line from Lake Nipissing to Lake Superior, reported only one small burnt area, in the Wahnapiatae district.

Nearly the whole north shore and Manitoulin Island was virgin forest up to 1864, when a fire started at the mouth of the Serpent river in a slashing and burnt over more than 1,000 square miles of timber. I wish to say here that Indians are never the cause of forest fires.

In 1871 a fire started near French river and ran through the Sudbury country west to the Mississagi district, burning over 2,000 square miles of timber lands.

In 1896 a fire started near Biscotasing by a spark from an engine and burnt over 2,000 square miles of timber country. A surveyor told me that he saw the fire start, and if he had been able to get two or three pails of water he could have put it out.

Over a thousand square miles have been burnt along the line of the Grand Trunk Pacific prospective route since their surveyors went in; 500 miles of this is in the Kenogami region, about the finest country north of the height of land, and timbered with fine spruce forest; most of the other 500 miles is north of Lake Nipigon in the District of Thunder Bay. I might mention many other forest fires, but will not take up your time now.

A large percentage of our loss in timber wealth since Confederation has been by fire. For the past 20 years I have been urging the Government to establish more efficient means of protection against fire, and I think we should take it up more earnestly than ever before. Every practical lumberman knows that the pine lands in this province will reforest with pine as naturally as grass will grow, if only protected from fire. This can be done with great success by the employment of a sufficient number of good men as fire rangers. The rate of wages fixed by the Government and paid heretofore, as you know, has been \$2 per day for the fire ranging season from May 1st to September 30th, and the ranger bears his own expenses for shelter and provisions in the woods. Where fire rangers are watching on licensed timber lands the Government pays half and the licensee half. In the condition of the labor market for the past few years this will not procure the best men for the work. I have paid considerably more and furnished shelter and provisions for the rangers, and have proved the wisdom of so doing. I know of four instances where fire has started in our limits (twice from lightning) and in each case was discovered by the rangers and extinguished before any considerable damage had been done. If these men had not been there and carefully watching, no telling what amount of

destruction would have been the result. The value of timber destroyed in any one of these large fires I have mentioned would have paid the wages of an army of fire rangers for half a century. I am dwelling upon this subject at such length because of its very great importance, in not only preserving a sufficient supply of timber for future need, but in that way maintaining our abundant supply of water power. I am sure we are all glad that the Toronto University has established a Forestry Branch and that so distinguished a gentleman as Dr. B. E. Fernow, Professor of Forestry, is Dean of the Faculty.

The Minister of Lands, Forests and Mines has recently introduced a bill, No. 44, entitled "An Act to amend the Act to Preserve the Forests from Destruction by Fire." But this bill only provides that where fire rangers are appointed to enforce the law during the construction of a railway, he may appoint as many as he sees fit, to act not only during the construction but after the construction.

I think this question of fire protection should be discussed at this meeting.

A few years ago I tabulated all available information as to the quantity of timber growing in Canada and the United States, as well as the quantity consumed, and I found that the annual consumption, both in the United States and Canada, was a fraction over two (2) per cent. of the supply. In that condition, it was easy to calculate how we might have a perpetual supply, as healthy timber well protected would increase by growth more than 2 per cent. annually. I have not had time at my disposal to make a similar calculation of the situation now, but fear that on account of destruction by fire and storm and waste in cutting and manufacturing, the situation has changed for the worse, but it is not too late even now to regain a position of safety.

Perhaps you may wish to discuss other Crown land and timber matters, namely, settlers locating on timber lands under various conditions, the hemlock bark question, and other matters which may occur to you.

Two bills are introduced by the Minister of Lands, Forests and Mines—No. 47, to Amend the Rainy River Free Grants and Homesteads Act, and No. 48, to Amend the Free Grants and Homesteads Act. These bills provide for the locating of agricultural lands, giving the settler all timber and minerals, but so far as pine trees are concerned, shall not apply to lands under license.

There are transportation questions which engaged your attention last year, not yet settled, namely, staking cars, reciprocal demurrage, interswitching, and uniform bills of lading free from special conditions. These were taken up by your committee, associated with Mr. John Walsh, transportation manager for the Canadian Manufacturers' Association. Mr. Walsh is here and will explain to you the present condition of each one of these matters.

I have occasionally heard it said that this Lumbermen's Association is a combine, and perhaps it would not be out of place for me to say that since I became a member of the first Ontario Lumbermen's Association, over twenty years ago, and which was changed into the present form in 1898, nothing in the nature of a combine has ever been even spoken of by any member, so far as I am aware.

I have the feeling that this address is becoming too lengthy, otherwise I would refer to some other matters. Let me say to you in closing that every man should be benefitted by attending a meeting like this, and the way to get the most out of such a meeting is to put the most good into it that you possibly can.

The Secretary's financial statement followed and showed the Association to have gained considerable ground during the year. The following statistical statement was also submitted by the Secretary:

STATISTICAL REPORT.

GENTLEMEN,—

I beg to submit the following information for your consideration:

PRODUCTION.

The territory of our Association in Northwestern Ontario embraces all mills on Georgian Bay, Northern Division of the Grand Trunk Railway to Callendar, Canadian Northern Railway, Canadian Pacific Railway, North Bay to Kenora.

I am unable to give you the production of the territory above on account of not having received reports from some of the mills, but, as regards the province, the Government reports from 1906 give the production of saw logs and square timber as follows:

WHITE PINE.

1906—711,976,683 feet B.M.

1907—780,000,000 feet B.M. (no report, estimated). Increase, 70,023,323 ft.

1908—600,000,000 feet B.M. Decrease, 180,000,000 feet.

OTHER WOODS.

1906—75,453,474 feet B.M.

1907—85,000,000 feet B.M. (estimated). Increase, 9,546,526 feet.

1908—55,000,000 feet B.M. (estimated). Decrease, 30,000,000 feet.

The above are the best estimates I can make from information available; basing the condition of available supply for next year, and the relation it bears to last year, on the assumption that replies received are applicable to the whole district, it leads me to the conclusion that next year's supply of white pine will show a decrease from this year of 24 per cent.; and hemlock and other woods a decrease of 35 per cent. Of the stocks on hand January 1st, 1908:

As regards white pine, 64 per cent. is shown as being sold for winter and spring delivery, and 25 per cent. of hemlock.

Regarding question 4 of the circular letter, as to present prices being maintained, the answer in almost every case is yes, most particularly as regards the upper grades running to thick and wide stocks, and box and mill and dead culls. If any weakening at all, it is in narrow stocks, widths below 6 inches. From reports in

British Columbia's Forests

The extent of British Columbia's timber area is given as 182,000,000 acres, the most of any single province in the Dominion. The growth is much more dense than in other portions of the Dominion, the average yield per acre along the coast being about 45,000 feet, while in the interior it would probably run from 20,000 to 25,000 feet.

At present there are about 200 mills in the province ranging from the one-saw portable affair to large plants equipped with every modern saw mill device. Roughly speaking, the capital invested in the industry would be \$10,000,000, with a monthly pay roll well over the \$1,000,000 mark.

In dealing with the various forms of timber growth common to the province, Douglas fir (or Oregon pine, as it is sometimes termed) ranks first in importance. This tree has been known to attain a height of three hundred feet, ranging from six to eight feet in diameter at the butt, its only rival in size being the Redwood of California.

Fir forms about sixty per cent. of the marketable timber, and although confined to no particular belt, attains its greatest sizes in the valleys of those rivers emptying into the Gulf of Georgia, and on the eastern part of Vancouver Island—the latter being the most densely wooded area in British Columbia.

The age of a full-grown fir averages about five hundred years, but specimens six and even seven hundred years old are not rare. In the early stages of the tree's growth the foliage is very thick, branches spreading out from the trunk in all directions; these gradually disappear, however, until nothing remains but a few stunted limbs at the top, the lower portions being comparatively free from knots. The bark growth is heavy, of a reddish appearance, and extensively used for tanning purposes.

The commercial value of this wood is too well known to merit extensive mention. For general all-round purposes it has no equal, especially in heavy construction work, owing to its ability to withstand enormous strains; and in this respect is equal if not superior to oak, which wood it is rapidly displacing, especially in the building of cars. Tests have recently been made by railway engineers on several of the large systems, with a view to comparing the relative strength of the two woods, and in most instances their reports have been favorable to fir, particularly where long timbers are required. In one instance ten pieces of each wood were selected and a lift made until they broke, with the result that the fir withstood some six hundred pounds greater strain than oak, conclusively proving its superiority in this regard, not to mention its advantage in lightness. Fir is also well adapted for house construction, being used in every portion of the building. Mention should also be made of the excellent spars and masts procured from this tree.

Next in commercial importance, as well as size, comes the red cedar. Although indigenous to all parts of the province, this tree does not thrive as well in the interior as along the coast, where it attains an enormous growth, almost equal to that of the fir, especially at the butt, which has a tendency to spread and is generally hollow. The interior, or mountain cedar, as it is often termed, is much closer grained and considered superior in grade to the coast product.

Cedar is noted for its lightness and the ease with which it can be worked, rendering it in great demand for all classes of interior finish and factory work. In the manufacture of shingles, however, this wood excels, the British Columbia shingle enjoying a reputation second to none on the continent. Owing to its lasting qualities underground, cedar is much used for fence posts and foundations.

Hemlock grows in abundance along the coast, but is not so common in the interior, except where the rainfall is heavy. Hitherto, owing to the great prejudice existing against it, the product of this tree has not been extensively used. For a great many purposes, however, it is equally as serviceable as fir (which it closely resembles), and is beginning to be more generally called for, chiefly as a substitute for the latter wood.

Spruce, in several varieties, grows in all parts of the province, but its principal habitat lies along the coast. To the south it is found

interspersed among the other trees, but farther north the greater portion of the timber consists almost entirely of this wood. In the interior the valley of the Columbia river also contains large tracts of first-class spruce. When manufactured into lumber, it is extensively used for house construction purposes, the commoner grades being worked up into box material, for which they are admirably adapted owing to the extreme lightness of the wood and the fact that it is almost odorless.

Neither hemlock nor spruce attain such large proportions as fir or cedar, their average height ranging from seventy-five to one hundred feet.

The above-mentioned form the bulk of the timber of the province, but do not by any means complete the list. Yellow cedar (or yellow cypress) belongs to the same family as red cedar, its dimensions and appearance being similar to the former. It grows chiefly along the northern coast and on islands adjacent thereto. For interior finish this cedar is unequalled. It is also said to be impervious to the attacks of the teredo, and lasts well underground. Oak occurs in small quantities on the southern end of Vancouver Island, but the trees are stunted and of little value as lumber. Alder and poplar are common all over the southern part of the province, where they thrive best in low-lying ground and along the banks of streams. Owing to the softness of these woods they have not so far been considered worthy of attention from a manufacturing standpoint. There are several varieties of maple, the principal being what is known as "broad leaf," on account of its large, spreading leaves, making it an excellent shade tree. Owing to the curly appearance of the wood when cut, it is also in great demand for panel work. White pine of a very fine quality also occurs in small quantities.

The greatest activities in the manufacture of lumber are naturally centered around those points where proper transportation can be had for marketing the products, and yet not too far distant from the bases of timber supply. For this reason nearly all the large concerns are located at the coast, where they have the advantage of both rail and water connection, combined with their proximity to the larger timber areas. But it must not be implied from the above that the industry is confined to this portion of the province alone—mills are established all through the interior, principally along the line of the Canadian Pacific Railway and its branches. The Northwest Provinces are the chief market for the output of these interior mills, and the heavy demand from this source during the last few years has resulted in a marked development of the lumber business throughout this district, where the manufacturer is in a more favored position in catering to the wants of the prairie market, especially as regards freight rates.

No less noticeable, however, has been the development in the older established centres on the coast, the demand being far in excess of what the mills were able to handle, notwithstanding the fact that over three million dollars have been invested during the last twelve months in the installation of new plants and additions to those already doing business.

The principal markets of the British Columbia mills in disposing of their timber are the Northwest Provinces and Manitoba, which use at least forty per cent. of the output on the coast, and practically the entire cut of the mountain mills, or about sixty per cent. of all the lumber produced in the province. In fact, these markets are the key to the industry, as with the exception of the local trade they are the only source which absorbs the common grades, unsaleable in other directions.

Owing to our disadvantage in the matter of freight rates and the strong competition from the southern pine districts, the Eastern Canadian trade is not very extensive, except in shingles and heavy timbers, but gives great promise for the future.

The foreign business (by which is meant the cargo trade) ranks next in importance, the principal markets being the United Kingdom, west coast of South America, the Orient and Australia, although shipments find their way to all parts of the globe and enjoy a high reputation wherever sold. This branch of the trade is carried on extensively by several of the coast mills, who make a specialty of catering to it almost exclusively. Up to the present the bulk of the foreign business has been handled by sailing vessels, and this has been something of a drawback owing to the length of time required in delivery; but steam freighters are now becoming more numerous, and their freight rates rea-

sonable enough to permit of the lumber being shipped in this way, thus obviating the necessity of having to rely on the slower and uncertain means of transportation afforded by "sailers." One hundred million feet may be taken as a fair estimate of the cargo business done during 1906.

The balance of the cut, about 120,000,000 feet, is represented by the demands of the local market, and with the gradual development of the province the major portion of the output will eventually be absorbed for home consumption.

So far nothing has been done towards utilizing the tremendous amount of material now wasted in the production of lumber, the greater part of it being either burnt or thrown away as refuse. This waste, representing as it does millions of feet every year, could all be used to advantage in the production of any number of marketable commodities. In other lumber centres, with the vision of an ever-diminishing supply in the raw product before them, they have learned its true value and are seeking to make the most of their opportunities while they last.

Take the production of wood alcohol, for instance. This is a flourishing industry in itself in places, and yet there is not a single plant in operation in this province. The same remarks apply to turpentine, which some of our woods contain a good percentage of.

Another opportunity for the utilization of our lumber by-products is presented in the manufacture of all classes of woodenware and furniture, for in this way a vast quantity of first-class short material, now consigned to the fire or woodpile, could be worked up into saleable articles of every description. Just what to do with this short lumber is one of the most aggravating problems which the millman has to contend with. The local market alone would justify the establishment of such a plant, to say nothing of its possibilities in other directions. A glance at the factories on the Ottawa river—Hull in particular—will show what can be accomplished in this line.

Sawdust, once considered of no use whatever, except as fuel, is now manufactured into imitation marble and sold at a price in excess of the lumber, in the manufacture of which it was created. Several plants of this kind are in operation elsewhere, and pay high dividends.

In fact, there is no portion of the log which cannot be put to some profitable use. A large portion of our small timber, now considered worthless, is capable of being utilized—poplar, for instance, a tree said to be highly adapted for the manufacture of excelsior packing.

The great fault out here in British Columbia is that we have an overabundance of timber wealth, and these apparently small items are lost sight of. It has been stated on good authority that the amount of material thrown away or burnt up as refuse during the last quarter of a century, in the United States alone, if available to-day, could be worked up into saleable commodities valued at five hundred million dollars. This goes to show what the apparently small leaks mean. British Columbia is considered one of the world's great gold-producing areas, but the amount of material annually wasted in the production of lumber will more than counterbalance the value of the gold mining during the same period.

Mention should also be made of the great possibilities for the manufacture of pulp. Both fir and spruce, especially the latter, are admirably adapted for the production of this article, and as these woods are found in all parts of the province, the supply of raw material is unlimited, especially along the coast and on Vancouver Island. In the southern part fir is the predominating wood, but farther north the growth of spruce is most abundant—and on account of the nearness of the timber to waterways the problem of transportation is in a great measure simplified.

It is not likely that the industry will assume very large proportions in the interior for some considerable time, owing to its disadvantage in the matter of transportation.

Although active operations have not as yet been commenced, the province bids fair to eventually become the chief centre for the manufacture of this article. The available supply of raw material is being rapidly depleted in the Eastern American States, and even now they are forced to secure the bulk of their wood supply from the Provinces of Ontario and Quebec. When these sources are exhausted the paper manufacturer must look elsewhere, and British Columbia will be his only resort.

The principal markets which could be supplied are Japan and Australia, both of which countries are large pulp buyers. This trade is now controlled by the British and American mills, but there is no reason why concerns established here could not compete for the business. The cost of labor may be higher, but the British Columbia manufacturer would have the advantage of cheaper power, as there are numerous sites along the coast where excellent water power is available. The time and money represented in transportation across the continent would also be saved, a lever which would go a long way towards enabling him to control these markets. Several companies have been formed and timber limits acquired in anticipation of these conditions.

Preserve the Forests.

"To protect the welfare of the unborn citizen—that is the mission of the forester, which makes him a world patriot," said Dr. Fernow in an address upon reforestation, delivered on February 24th last, to the members of the Toronto Canadian Club.

Dr. Fernow very convincingly showed the necessity there is for prompt action in order to conserve the forest wealth of Canada for future generations. "Are you aware," he asked, "that Canada is destined to have ten times her population in less time than it takes to grow a saw-log? Are you aware that our neighbors to the south have only thirty years' supply of timber in their forests, and that one result of the removal of United States restrictions in regard to Canadian wood products will result in an enormous increase of activity in Canadian lumbering operations?"

Addressing himself to the means to be employed in dealing with the problem, he continued:—"One essential condition is to keep the fire out. The present method of fire ranging only looks to the protection of the existing sawlogs, and does not look to the preservation of the young growth, which is the more valuable timber to the nation. The present method is the way which kills the goose that lays the golden egg." The future of the timber wealth of Canada, he said, depended upon the policy adopted by the eastern Provinces.

At present the cutting is done with the sole aim of making immediate profits, and very little attention is paid to caring for the young trees. Ontario is the Province most deeply concerned, for she has more virgin timber than any other.

Usually a Government's policy in regard to timber lands was "a waiting one, with a tendency to hang back," and not much success could be looked for until the moral sense of the community was educated to appreciate that it was a sin to destroy valuable property wantonly.

If present license holders were to have their privileges curtailed or cancelled, it was only right that the Government should pay them compensation.

In the United States, where land-grabbing is a fine art, the nation had reserved one hundred and fifty million acres for reforestation, and is going to spend millions in the repurchase of Eastern lands for reforestation purposes.

"One great difference I observe between Canada and the United States," said Dr. Fernow, "is that whereas there the people lead the Government, here the Government lead the people. There the people take the initiative, here it is the Government." This he did not think was entirely a wise and admirable state of public feeling in Canada. He urged the people to be more alive to the need of protecting the forests and enable Canada to dominate the timber markets of the world, suggesting that the Government be urged to extend its reservation policy to include all undisposed of limits; that it organize a reforestation department and substitute the ephemeral fire ranger for the permanent forester; that all Crown Lands suitable for forestry purposes be segregated; and that all present license holders be given notice that after a certain date new regulations must be observed on the limits, as a condition of the privileges enjoyed by them.

The following preparation is said to be an excellent preventative of dry rot: Melt 12 ounces of resin in an iron pot and add 3 gallons of fish oil and 1 pound of flour of sulphur. When all has been thoroughly mixed, color to suit with any earthy color—ochre, Spanish brown, etc. Have the wood warm and apply the paint while it is hot. Give two coats.

Nova Scotia's Timber Wealth

The following table shows the names of the counties of Nova Scotia, the "acknowledged" acreage of forest lands and the value of the product:—

Country.	Acreage.	Value.
Annapolis	166,000	\$212,000
Antigonish	100,000	70,000
Cape Breton	159,000	79,000
Colchester	251,000	267,000
Cumberland	226,000	818,000
Digby	120,000	197,000
Guysboro	181,000	120,000
Halifax	264,000	236,000
Hants	236,000	189,000
Inverness	291,000	153,000
Kings	73,000	168,000
Lunenburg	212,000	245,000
Pictou	155,000	161,000
Richmond	120,000	38,000
Shelbourne and Queens	107,000	290,000
Victoria	111,000	59,000
Yarmouth	65,000	100,000

Total.....2,800,000 \$3,409,000

The following is a summary of the classes of products in value:—

Hemlock logs	\$ 237,814
Oak	15,207
Pine	144,907
Spruce	1,272,653
Other	168,956
Tanbark	12,803
Fence posts	52,873
Firewood	1,094,217
Piling	128,181
Railway ties	60,783
Staves	37,124
Pulp wood	48,320

As the cutting of large timber and lumber for export purposes is being reduced, the attention of the public is being more and more drawn to Nova Scotia as a source for the supply of pulp wood. The soil and the moist and equable climate are favorable to rapid growth of spruce. As an example of the pulp wood capabilities of the Atlantic shore territory, a strip of territory has been cruised from the Mersey River to the Clyde. The section 8 miles west and 20 miles back to the head waters of Broad River will yield 225,000 cords. The second section, 11 miles west, along the shore and north by West Brook, a distance of 20 miles, will cut 175,000 cords. The third section, west of Granite Village stream, into Sable River, and including the Tom Tigney, a distance along the shore of 6 miles and 25 miles north to West River, will yield 500,000 cords. The fourth section, west to the Jordan River, 9 miles and 25 miles to head of that river, will yield 400,000 cords. The fifth district, west of the Jordan to the Shelbourne, 7 miles, to the head waters, 15 miles, will yield 250,000 cords. The sixth district, west of Shelbourne River to the Clyde, 15 miles, and north 25 miles to the head waters, will cut 750,000 cords.

Thus, 1,200 square miles will cut 2,300,000 cords. It is usual to estimate an acre of fair land to produce 10 cords of wood. Estimating the burnt over portions of granted land as equal to the producing portions of ungranted lands, there are for 2,800,000 acres, a present growth of 28,000,000 cords of pulp wood. As the growth of this wood from 5 inches to 8 inches requires about 12 years, it is reasonable calculation that Nova Scotia could supply 2,333,000 cords per annum forever, if the fires were kept out of the forests.

Against this the present annual local demands are:—

	Cords.
Sissiboo pulp mills	6,000
Mill Village pulp mills	5,000
New Germany pulp mills	3,000
St. Croix paper pulp mills	500
Milton paper and pulp	8,000

Total.....22,500

While the figures relating to the present extent of pulp wood growth are only approximate, it must be evident that if the growth be conserved by protection from fires, by judicious cutting and by replanting, the annual wood crop of this Province will compete with the great mineral output, for the foremost place as an employer of labor, and a producer of wealth.

While pulp wood is found in every county in the Province, the localities in which it is chiefly cut, are Queens, Shelbourne, Digby and Hants. Large quantities are cut in Cape Breton for export.

The mining sections of Cape Breton, Pictou and Cumberland are making continually larger drafts in timber lands for pit props, while the railways are demanding each year larger quantities for ties. The demand has doubled the price within the past eighteen years. Both the demand and price are likely to increase in the future, so that the owner of a productive timber property is likely to make money by holding it and protecting it against fire.

Insurance for Lumbermen and Woodworkers.

In another column will be found the advertisement of Messrs. Burnett, Ormsby & Clapp, Limited, a well-known firm of insurance brokers, having offices at Toronto, Montreal and New York. These gentlemen have for a number of years made a specialty of handling the insurance on manufacturing plants, special attention being paid to woodworking establishments. The business which was commenced in a small way about ten years ago, has now grown to such dimensions that offices are maintained in three cities, Toronto, Montreal and New York, as well as the original office in Woodstock, Ont., the staff at the various offices now numbering over twenty-five individuals, besides the three principals. The firm, besides having a very large connection with insurance offices all over the world, including London Lloyds themselves, control the Ottawa Fire Insurance Company, and through their re-insurance arrangements are in a position to write very large lines in their own office. A staff of competent inspectors is kept at the service of their clients, and every effort is made to keep down the fire loss by careful attention, the result of this system being evidenced by the fact that, while woodworkers are not looked upon favorably by most companies, the average losses on those controlled by this firm during the last eight years amount to less than half the usual average on such risks, and in many cases the premiums have been materially reduced.

We would recommend any of our readers who are interested in the important question of fire insurance to communicate with Messrs. Burnett, Ormsby & Clapp.

Annual meeting of A. J. Burton Saw Company.

The fourth annual meeting of the A. J. Burton Saw Company, Limited was held in the company's office, Vancouver, on February 17th last. The directors declared a 20 per cent Stock Dividend to shareholders, the annual report showing that the company had made very rapid progress during the past year. A large amount of new machinery had been installed to meet the increased demand, and the plant itself enlarged to accommodate the added equipment. All the officers of the company were re-elected, as follows:—President, E. W. MacLean; Manager, A. J. Burton, and Secretary-Treasury, Geo. J. Palmer.

These gentlemen, together with C. D. Rand, and Dr. W. E. Emmons, form the board of directors.

Lumbermen's Association of Ontario.

(Continued from Page 17.)

United States press, the same condition prevails there. It has been urged that the competition of yellow pine will affect the price of hemlock, but it is hard to understand why it should to any great extent in the face of 266 mills showing a decrease of 273,844,000 feet, and the closing down of 135 mills.

It may be of interest to note that the receipts of lumber in the Chicago market from the year 1901 show an increase in receipts of 491,878,000 feet.

Another item of interest is that from reports received available stock in the Buffalo and Tonawanda markets at close of navigation show a decrease of 23,000,000 feet, principally in the grades of No. 3 cuts, common and dressing, and box and culls of all kinds.

Respectfully submitted,

W. B. TINDALL,
Secretary.

ELECTION OF OFFICERS.

The Board of Management and Officers for 1907 were continued for another year, with the exception that Mr. James Playfair takes a seat on the Board to fill the vacancy caused by the death of Mr. John Waldie. The personnel of the Board is: President, Hon. W. A. Charlton; 1st Vice-President, W. J. Smith; 2nd Vice-President, W. B. MacLean; Secretary-Treasurer, W. B. Tindall; Board of Management, James Playfair, J. Donogh, W. C. Laidlaw, E. W. Rathbun, J. B. Miller, W. D. Lummis, W. P. Bull.

TRANSPORTATION PROBLEMS.

Mr. Walsh, manager of the Transportation Department of the Canadian Manufacturers' Association, was then requested to outline the position in respect to car staking, demurrage, etc. The car staking question, he said, was still in status quo, as our Railway Commission would not make a ruling until a decision had been reached at Washington. Reciprocal demurrage was also in an unsettled condition, the Railway Commission having the matter before them. Another question was a uniform bill of lading. The Railway Committee of the Canadian Manufacturers' Association had asked permission from the Commission to file a bill of lading, but this permission had not yet been granted. Mr. Walsh contended that there is no reason why the railways should not assume the responsibility for the goods through to destination. In respect to inter-switching, the chief traffic officer of the Board had recommended a reduction of fifty per cent., but the railways had not given a reply in regard to it.

After considerable discussion, which unanimously condemned the interswitching charges, Mr. Robert Laidlaw moved that a strong protest be entered against the policy of the railways in collecting such charges, and that lumber manufacturers not at competitive points should be given the same rates as industries located at competitive points. The motion was seconded by Mr. Barclay and carried unanimously.

SETTLERS VERSUS LUMBERMEN.

The President asked the opinion of the meeting in respect to the bill now before the House calculated to give the settler still greater privileges on licensed lands.

Mr. Burton said the matter was becoming very serious. Hundreds of instances could be cited where bogus settlers had stripped the land of the timber and "jumped." He thought the Government should make the regulations more stringent as to settlement. The percentage of agricultural land should be at least 60 per cent. before allowing it to be withdrawn. Bona fide settlers were wanted, but not timber thieves.

Mr. Miller pointed out that, even when the lots are abandoned by the bogus settler, they do not now revert to the licensee, although he continues to pay ground rent for them. The Government seemingly did not recognize any value in timber except pine. A motion was adopted that the Board of Management arrange for a deputation to interview the Government on the subject and also to consider ways and means of finding a more profitable market for hemlock bark.

On motion of Mr. Bull, Dr. Fernow was made an honorary member of the Association. This concluded the business of the meeting.

To mark tools, first cover the article to be marked with a thin coating of tallow or beeswax; then with a sharp instrument write the name in the tallow. Clear with a feather; fill the place written—the letters—with nitric acid; let it remain from one to ten minutes, then dip in water and rub off, and the marks will be etched in the steel or iron.

B. C. Lumbermen Urge Claims on Government.

A delegation of some 50 lumbermen recently waited on the Executive of the British Columbia Legislature to present their views on behalf of the lumbering industry. Dr. Judson Clark, secretary of the B. C. Timber and Forestry Chamber of Commerce who, as spokesman of the delegation, presented their claims as follows:—

1. That the present yearly licenses be made renewable until the timber held thereunder is logged off.
2. That the present annual rental shall not exceed during the whole term of the license, \$140 west of the Cascades, and \$115 east of the Cascades.
3. That in the case of default of payment of a license fee on the due date, not less than 12 months be allowed to renew the license; that a notice of 60 days be given before the license is cancelled; that interest at the rate of ten per cent. per annum be charged on overdue accounts; and that this provision be made retroactive in the case of all lapses occurring since the passing of the Order-in-Council reserving vacant lands.
4. That all licenses bear a permanent number.
5. That on surveys of timber licenses being made and such surveys proving that the licenses overlap each other, a proportionate reduction of license fee be made in order that the license holder will not be called upon to pay more than a proper proportion of the annual license fee for the ground he holds under his license.
6. The attention of the Government is called to the fact that when claims are surveyed there will undoubtedly be found many small areas of merchantable timber lying between and adjoining claims, which in the best interests of all concerned should be logged at the same time as the limits, which they adjoin, and that statutory provision should be made covering the point.
7. That provision be made permitting the taking up of small areas of Crown timber by operators for immediate operation.
8. That inasmuch as there is a constant uncertainty amongst operators, as to the amount of royalty to be paid in future for timber, and because of the fact that there is already a difference in royalty paid on different holdings we believe it to be in the interest of the Government to fix said royalty at 50 cents per M during a term of years, and that the said royalty should at no time exceed the amount in force on timber held under lease.

Wooden Buildings.

Cement and steel and brick and stone are not yet used in sufficient quantities to encourage lumber users to predict the time when the forests will not be called upon to furnish the principal materials used in building operations. Notwithstanding the remarkable increase in the use of cement and other fireproof materials, the last reports of the building operations in forty-nine of the leading cities of the United States, as compiled by the Geological Survey of that country, show that for the year 1907 fifty-nine per cent. were of wooden construction. Even if the remaining forty-one per cent. of the buildings were built of brick, stone and concrete, vast quantities of wood are consumed both in the construction and in the finish, though in the latter form metal is taking the place of wood to a very large extent.

These figures also take no cognizance of the fact that large quantities of lumber are used for the construction of dwellings, stores and other buildings in small cities and towns. In these wood is usually the predominating building material, and it is safe to say that if the statistics had included figures for all places of all sizes the percentage of wooden construction would have been very much greater.

In the number of wooden buildings New York city is shown to be at the bottom of the list, though it leads with \$18,075 as the average cost of its buildings. This average cost for the forty-nine cities reported on is placed at \$2,035, this being an increase of over \$300 during the past three years.

Paper manufactured from the fibre of trees began to be a commercial product in 1867, but did not assume great importance until 1890.

Western Retail Lumbermen's Association Hold Annual Meeting.

On Wednesday and Thursday, February 19th and 20th last, there was held in Winnipeg, the annual convention of the Western Retail Lumbermen's Association.

D. E. Sprague, the retiring president, reviewed the work of the Association during the past year, and referred to several proposed changes to meet new conditions. At the time that the honorary members withdrew from membership, the Association passed a resolution to the effect that all persons in companies having a regularly established lumber yard would upon application receive membership. The manufacturers were at that time selling to non-association yards and they had continued to do so ever since, notwithstanding the evidence before the commission at Ottawa last winter. He therefore recommended that the only conditions imposed should be: "(1) The establishment of a yard sufficiently stocked and equipped to comply with the regulation of the Association in that respect; (2) the execution and delivery to the secretary of the requisite application for membership; (3) the payment of the regular entrance fee and dues."

At present said Mr. Sprague, "there did not appear to be any good reason why a man who was willing to risk his money in the retail lumber business should not be able to secure membership. The directors' policy had always been to provide a healthy competition in all localities, and he was convinced that if the policy he suggested were adopted there would not be any more dealers than there were at present. The membership list at present contained the names of all the retail dealers in their territory. The names of those who are not members were marked with an asterisk, with a foot note stating that they were "legitimate dealers." The idea was to give manufacturers a complete list of all those engaged in the retail business, to any of whom they were entitled to sell. This was done from the most disinterested motives, and nothing could be fairer to the manufacturers or retail dealers outside the Association membership. This very generous act of theirs had been misconstrued and misrepresented in certain quarters, the interpretation being that issuing a list in the form mentioned was a deep laid scheme to prejudice the independent dealer, and that it was notice to the manufacturers not to sell to him. This contention was absurd. If they had desired to place the independent yards at any disadvantage, so far as their relations with the manufacturers were concerned, they would have left their names off the list altogether, and not have given them prominence as "legitimate dealers," while they knew the manufacturers made no distinction between them and Association yards in the matter of sales.

The select committee at Ottawa last winter sought to establish the point that retail dealers who were not members of one or other of the retail associations could not buy lumber from manufacturers. This phase of the lumber situation in the West appeared to have been established to the satisfaction of certain members of the select committee in spite of the testimony of more than one manufacturer that they did not discriminate in selling lumber between Association members and independent dealers. Other witnesses testified that there were dealers and companies operating line yards, who were not members of any association, and who secured their lumber from the coast and mountain mills as freely as the Association dealers could.

The officers of the Association elected for the coming year were: B. Housser, of Portage la Prairie, president; T. B. Patton, Regina, vice-president.

At the meeting of the Retail Lumberman's Mutual Fire Insurance Company, held on the second day of the convention, the following officers were elected: J. A. Thomson, president; A. K. Godfrey, treasurer and vice-president; A. M. Stewart, secretary. The statement for the past year showed that an increase of \$225,000 in insurance had taken place during the year, and that the reserve fund was strengthened by the sum of \$5,000. The fire losses for the year amounted to \$555.85. It was decided to increase the maximum risk from \$2,000 to \$5,000.

Mr. E. A. Barnett, who some time ago entered the firm of Campbell & Carman, this city, and who has since represented that firm on the road, has resumed his former position as manager of the Gold Medal Lumber Company.

Canadian Capital for Mexican Timber.

Our attention has been directed by Mr. Doods of the Doods-Cook Lumber Company, this city, to the growing importance of Mexican timber exports and the advisability of Canadian capital securing interest in timber and agricultural lands in that country. Mr. Dodds has secured an option on a tract of 130,000 acres a short distance south of Palomeres, on the Tehuantepec National Railroad. The land is well drained and rich, being capable of producing grain, roots, hay and all kinds of tropical fruits and nuts, with about half the labor required in northern cultivation.

In general there is on this tract a heavy stand of high mixed timber of such density as to prevent the presence of thick undergrowth and thereby reduce the risk. The percentages of hard and soft timber are about equal, there being a greater number of hardwood trees, while the soft woods attain a greater height. The woods of the tropics have not yet been extensively used, but their strength and durability have been amply tested. Recently also the needs of civilization have compelled a more careful investigation into the value of these woods and at present actual tests are proving them to be as valuable as the timber of North America, while having a much higher percentage of clear lumber. Every want in the lumber trade, Mr. Dodds thinks, can be supplied, and sawn lumber of high grade can be delivered at New York and Britain cheaper than from any other part of the globe. The soft woods are of fine texture, resembling pine and, while not possessing the durability of the tropical hardwood, can be used for the same purpose as the soft woods of the North.

No one familiar with the lumber trade of the United States and Great Britain will hesitate to admit that there should be a profitable market for Mexican hardwood, while the local demand is continually on the increase. The three railroads adjacent to and serving this district, the Tehuantepec National, the Vera Cruz & Pacific and the Pan-American import nearly all their material for car construction, ties, bridges, etc., which material should naturally be procured locally. The income from tie timber alone in Boca del Monte would net a substantial dividend on the necessary investment for purchasing this land and railroad and saw mill equipment, as there is an unlimited market for ties delivered at the railroad for \$1.25 to \$2.00 each, according to the quality of the timber. These railroads consume at least three to four million feet per year and the officials of the first two have already signified their willingness to purchase Boca del Monte products as soon as they are available. Besides the returns from timber, the revenue from the cultivation of the banana, rubber and cocoa trees furnishes a prolific source of revenue.

Boca del Monte possesses the best railroad route for the opening up of millions of acres of rich agricultural and timber lands, while electricity can be developed at the numerous rapids and waterfalls in both the Sarabia and Coazacoalcos rivers for the supplying of power in abundance for railroad, saw mill, ice plant, or any other desired purpose or industry. Moreover, the products of the sail can be delivered at the Gulf of Mexico, where there are large steamship lines in direct communication with the most prominent ports of the world, or it can be delivered by water at San Lucrecia and make connection with the railroad transportation to any station on the continent of America, as this is the junction of the Vera Cruz and the Tehuantepec National.

Mr. Dodds would be pleased to hear from anyone interested in this subject with a view to encouraging the investment of Canadian capital in a promising undertaking.

A Sea Breeze.

That striking painting "A Sea Breeze" has been utilized by Messrs. R. Macfarlane & Company, lumber dealers, Montreal, in producing one of the most striking New Year souvenirs that we have had the pleasure of receiving. The reproduction of the painting forms a panel 10 by 20 inches and is quite large enough to lose none of the beauty of the original. As a work of art and a tribute to the enterprise of Messrs. R. Macfarlane & Company it would be difficult to suggest anything more appropriate.

Market Correspondence

Ottawa Valley Lumber Outlook.

Ottawa, Feb. 24, 1908.—The lumber manufacturers of this district expect a demand for medium grades of pine, the coming season, sufficient to raise prices. The money depression in the United States is regarded as an influence which will keep the finer sorts from advancing in a similar way. Early next month will witness some contracts concluded and speculation for the season's trade will then be made on a better basis. Shipping is quiet and was somewhat hampered during the month by the heavy storms. Although lath is plentiful, the price is not weakening. The output will be as usual in 1908, as all the lath wood of the mills will be manufactured, so that lath stands a change of taking a drop. Local builders would welcome such a turn as the present rates of \$3.50 and \$4.00 for white pine, are looked upon as excessive. Despite a quietness in trade all the upper grade shingles are practically out of the market and the prospects of present prices being maintained are good. Lumbermen, however, anticipate congestion in the lower grades.

J. R. Booth has brought down about 2,000 cars of logs by rail. They are lying on the ice to be manufactured at the earliest convenience. He will have another fortnight's hauling of logs in the shanties and about that time preparations for the drive will begin. The outlook is that river men will be secured this season for an average of \$30 per month or about \$10 less than last year. There is a big demand for railway ties, of which the Booth establishment turns out 100,000 a year. These are all used on the Grand Trunk Railway System. Owing to shortage of power or anchor ice, the Booth pulp mill had to close temporarily on some occasions recently, and often not more than half of the 14 grinders were running. Last week following a thaw the Chaudiere fell lower than it had been all winter and power users on both sides had to resort to steam and electric plants.

The construction of a new dam across the Ottawa River, just above the Chaudiere, which is the outcome of the recent settlement of disputes among the power owners, has been taken up with a view to building the dam next summer, if the water is low enough. To-morrow Mr. George H. Millen, joint manager of the E. B. Eddy Company, and William Kennedy, C. E., representing Quebec interests with Mr. William H. Baldwin, hydraulic engineer of the Ottawa Electric Company, and J. B. McRae, C. E., representing Ontario interests, will leave for the Northwest for the purpose of gathering information that will assist in arriving at plans for the Chaudiere improvement. The estimated cost of the structure is around \$150,000. It will be of steel and concrete, located just below the present dam, and extending from shore to shore. The dam will be of great service in obviating the heretofore uncontrollable leakage. It is estimated that the increased power of the dam will be equivalent to 35 per cent.

An injunction has been served on Messrs. Shearer, Brown and Wills, of Montreal, to prevent them from building piers in the Lievre River, near their mills at Buckingham until they have obtained permission from the proper authorities. The objection has been raised by Mr. George Bothwell, a large shipper of the district who claims that the proposed piers will obstruct navigation. The plans for the works were deposited some time ago with the Minister of Public Works, and show that the piers were intended to be used for tying booms for the storage of logs.

Building operations in the city promise to be brisk, according to permits taken out at the City Hall. Though building is at a standstill during the winter months, permits totaling \$40,000 have been taken out since the beginning of the year. Almost all are for residences. The average cost of which is placed at about \$2,000.

The Red Deer Lumber Company's general sales offices have been removed from Barrows, Sask., to suite 306, Union Bank Building, Winnipeg, with Mr. A. R. Cavanagh, sales superintendent, in charge. The capacity of this company's mills is now forty million feet of spruce lumber annually.

News of Maritime Trade.

St. John, N. B., February 22nd, 1908.

Conditions in the lumber woods have changed materially since last mentioned; there have been several fairly heavy falls of snow and conditions for the getting of logs are much more favorable at the head waters of the St. John and along its branches. In some sections the total depth of snow is from three to three and one half feet.

In the more southern portions of the Province there is still very little snow and the loggers and portable mill people are suffering. Of course, the latter section is, from a lumbering standpoint, of little importance compared with the up-river districts.

The indications of a quiet summer in manufacturing circles in this vicinity are very pronounced. The local mill owners usually begin about the 1st of February, to overhaul and repair their plants. This year, nothing of the kind has yet been begun. Only two of the local mills are sawing; none of the others have shown any sign of life whatever.

There are some rumours to the effect that local manufacturers will endeavour to curtail the wages of their mill crews during the coming summer. Last year an increase of wages, amounting to about ten per cent., went into effect. It is probable that, if any cut is attempted, the amount would be the same as last year's increase.

The attention of local manufacturers, whose output goes all or in part to the American markets, is naturally turned in that direction at this particular time, with the idea of forming a conjecture as to what the future will bring forth in the way of demand and prices. While practically all of the higher grades of cedar shingles, all the lath and all the boards which are manufactured at this port, go on the Boston or New York markets, only such deals as are manufactured from logs, which have been cut on the American side, are shipped to the States. The quantity of logs cut on the American side for local manufacturers, is naturally a good standard by which to judge the output of "American" lumber during the ensuing season at the mills on the St. John River and at St. John.

The usual quantity of a winter's cut of "American" logs ranges from 45,000,000 to 50,000,000 feet. This year the quantity contracted for did not total more than between 20,000,000 and 25,000,000 feet.

The quantity of "American" lumber manufactured at local mills during last year, was about as heavy as usual, but the sluggishness of trade during 1907 had a decided effect toward curtailment.

There is little doing locally in the way of trade in "American" lumber. Practically nothing is going forward, and, with a very few exceptions, the schooners which engage in the freighting of lumber to the Eastern States are laid up at this port.

Local stocks of "American" long lumber are very light; there is less than half a million feet of spruce deals, perhaps 100,000 superficial feet of spruce scantling and 150,000 feet of non-dutiable, one-inch spruce boards. Of dutiable one-inch spruce boards the stocks at the local yards are fairly heavy; between 500,000 and 550,000 superficial feet would cover the quantity.

Advertising Pays.

There is no advertising like newspaper advertising. The merchant who tries the bill board or the fancy dodger, if he tests the matter thoroughly and conclusively, will find that the newspaper advertisement is the very best that there is. The big advertisers confine themselves exclusively to the newspapers. No merchant ever increased his business by bill poster advertising. A few weeks ago there was a strike in Butte, and for some days no newspaper appeared on the streets of that city. There was nothing for the advertisers to do but to resort to the bill board and the street bill. The result was that business fell off there, from twenty to fifty per cent. The decline was attributed solely to the fact that they had no newspaper to act as advertising mediums.—Calgary Albertan.

A useful wall calendar from the Waterous Engine Works, Brantford, has reached us.

Percentage Basis in Millwork and Contracting.

We continue to hear quite a lot about what is called the percentage basis in planing mill work and contracting work generally, and along with the reports of work being done this way, there is occasionally a word to the effect that it is the coming thing, and that the chances are decidedly in favor of much of the building work of the future being done on what is termed the percentage basis. What we would like to know, and to have specific information on is, what people generally regard as a fair percentage, says the "Woodworker." The general plan, as we understand it, is for the contractor or planing mill to figure on doing any given job of building, using the best practical efforts to keep the cost down to a reasonable basis, then charge in addition to the actual cost of the material and work, a certain percentage as profit for the contractor or planing mill. It will be recalled that some such basis of figuring as this entered into the proposition that was up some time ago to have the Panama Canal dug by contract.

Evidently the magnitude of the job should have something to do with the percentage charged. We would like to get straightened out on these things, if this method is to become popular and general. To figure work on a percentage basis presents certain advantages, and probably, on the other hand, an equal number of disadvantages. In case of fire or some occasion where it becomes decidedly important to have estimates for rebuilding immediately, the percentage basis readily furnishes a short cut to letting the contract and getting the work started. All the contractor needs to do is to get a rough estimate of the probable cost, then make agreements as to the percentage he is to be paid above the actual cost, after which he can get busy, and frequently have the work pretty well under way by the time it would take him and other contractors to get at their competitive bids through figuring all items in detail. On the other hand, of course, it puts the man who gets the work done into a position where he gets to know exactly what the planing mill will make in the form of profits, and practically eliminates the chance for big profits on the job.

These is, of course, some recompense in that, while curtailing the chance for big profits, this percentage basis practically eliminates the chance for loss. In other words, it puts the planing mill work and contracting on what might be termed a more positive basis, like loaning money out at a certain per cent.; you know beforehand what your returns will be, and at the same time you know that you cannot make what might be termed excessive profits. However, what we are after at the present time, is not so much a pro and con discussion of the possible merits of the percentage basis system, as to seek information on just what percentage is considered about right on jobs of given size, and other essential details, to make clear the idea of doing planing mill and contracting work on the percentage basis.

No. 312 Band Resaws.

A handsome example of the taste and expense that is lavished on trade catalogues is furnished by the Cordesman-Rechtin Company, Cincinnati, Ohio, who have forwarded us a booklet descriptive of their No. 312 Band Resaw. Strongly bound, clearly printed and copiously illustrated, the book is a tribute to the progressiveness of the firm whose goods it advertises.

Cooperage Stock in Good Demand.

In a recent communication regarding prices of cooperage stock the Sutherland-Innes Company, of Chatham, write.

"The year 1908 has opened with a very strong demand for cooperage stock of all kinds, both for present use and for future shipment. The financial stringency does not seem to have affected the consumers of cooperage stock to any great extent, and they seem to be laying for about the usual amount of business. A number of heavy contracts have already been placed with the manufacturers, and the consumers are covering up their requirement for the year.

"During the last week, there has been good sleighing throughout most parts of Indiana, Michigan, Ohio and Ontario, so that the mills are getting a fair supply of logs, wherever the manufacturers have the money to pay for the goods. It looks as if there will be a heavier cut of all kinds of stock than during the year 1907 in the northern part of the country. The south, so far, has not been very much in the way of lumbering, and the output there is bound to be restricted, not only on account of the difficulty of getting in the timber, but also on account of the difficulty of getting money to pay for the timber.

"Prices are much higher, on an average, than they were one year ago for contracting for future shipment, and the tendency is rather upward than otherwise, but this may be affected some by the good sleighing.

"Another month will tell pretty well what stock there is in at the mills, and about the 1st of March will fix prices for some time to come.

"To sum up the situation at the present time, it looks as if good prices for all kinds of stock are going to be maintained throughout the year, but the output will not be more than the demand, providing there is no decrease in the demand, as compared with 1907, so that the manufacturers are looking forward to a good year's business in 1908."

Old Don Paper Mills to Resume Operations.

It is said that the old Don Valley Paper Mills, known as the historic Taylor Paper Mills back in the seventies, are to start up again. Robert Davies, of Todmorden, Ont., bought in the property last year at auction sale, and has decided to start up the old mills and again produce paper. Mr. Davies has had an expert from the United States go over the entire plant and install new machinery throughout. It is intended to start up in the spring. The reason for the closing down of the old mills was the poor shipping facilities. The Canadian Northern Ontario Railway has come down through the Don Valley into Toronto, and has run a spur line to the mills. This will obviate the long haul for raw material and the finished product, which was the greatest trouble in the past.

It is said that C. W. Thompson, who had a lease of the old mills prior to the sale, is also arranging for a mill property in the Don Valley.

Gathering in Timberlands.

Some idea of the operations of the International Paper Company, otherwise known as the "paper trust," may be had from a statement recently made in the Wall Street Journal in connection with the application of that company to list for quotation a million dollars additional of consolidated mortgage convertible 5 per cent. bonds. According to this, the company owned at the beginning of the present year, in fee

simple, in the United States and Canada 1,115,000 acres of timber land and the stumpage on 2,950,000 additional acres, making a total holding of 4,105,000 acres. Here was an increase of 1,255,000 acres as compared with its timber possessions in November, 1906. Five years ago the company gave its timber lands a book value of \$1.50 per acre, which was apparently a very low figure; but even at a valuation now of only \$3 per acre its timber investments total more than \$12,000,000.

Pulp Logs Rising in Price.

A considerable rise has taken place in the price of pulp logs lately. The forest owner, however, had expected still higher prices. As it is, the increase will make a difference in the cost of a ton of moist mechanical about 80 cents, and about \$2.40 per ton of dry cellulose.

IN DISTRICT OF ALGOMA, ON THE Canadian Pacific Railway, and tributary to Georgian Bay. Virgin Pine of large size and superior quality. Estimates and price will be furnished by owners on application. Address Box 577, CANADA LUMBERMAN, Toronto. 6

New Schedule for British Columbia Loggers.

A new schedule for loggers has been fixed by the British Columbia Loggers' Association, which, it is thought, will prove generally satisfactory. Last year wages fluctuated considerably, going as high as \$7 a day with board. The new scale strikes a medium between the highest and lowest paid last year. It is as follows: Monthly men with board included—Per month—Chef (large camp), \$65; white cooks, \$60; flunkie, \$30; man and wife as cook and flunkie, \$80; Chinese cook, first, \$35; Chinese cook, second, \$35; string teamster, \$70; teamster (two horses), \$40; signal boy, \$20.

Daily men, board \$5.25 per week Per day—Blacksmith, \$3; blacksmith helper, \$2; boom man, first, \$3; boom man, second, \$2.50; greaser, \$2.25; faller, first, \$3.50; faller, second, \$3; undercutter, \$3.50; buckler, \$3; wood cutter (roader), \$2.50; wood splitter, \$2; head skidder, \$3.25; skidroad man, \$2; swamper, \$2.50; donkey engineer, \$3.25; donkey fireman, \$2.50; hook tender, \$4; rigging slinger, \$3; chaser for yarder, \$3; choker-man, \$3; signalman, \$2.25; sniper, \$2.50; barker, \$2.50; knotter, \$2.50; line horse man, \$2.50; dog up man, \$2.50; P. F. man, \$3.25.

Little Shipping from Hull.

A despatch from Hull, Ont., states that shipping of lumber from that vicinity is exceedingly quiet, owing to scarcity of money and the determination of manufacturers to maintain prices. Lumbermen have closed no large contracts for next season's cut, but it is reported that a few million feet of pine have been bought at an advance over last year's figure. Some manufacturers say they will not depend much on United States trade and will turn out more lumber for British consumption. If the demand is slack it will be easy to curtail the output because the winter's cut of logs is small. The smaller mills have not taken out enough logs to keep them going all summer. In most cases the supply of logs left from last year, owing to the late breaking up of the lakes last spring, will be used next summer and no corresponding surplus will be left over for 1909.

Shanty men are returning home in large numbers because their employers would not continue the high rates of wages of last season, the men refusing to come down from \$33 to \$25 a month. Many camps were allowed to close be-

cause the firms were willing to risk the season with a comparatively small supply of logs. In a couple of weeks hiring for the drive will begin and the lumbermen expect to get hands at from \$40 to \$45 a month. The recent thaw has made hauling difficult in the shanties, but previously the roads were good, the hard frost having been beneficial. Official records show that snow fall in this district this year was twice as much as last year.

B. C. Cedar Shingle Outlook.

In a letter to "The Timberman," Portland, Ore., Mr. E. H. Heaps writes from Vancouver regarding the British Columbia shingle outlook as follows:

The past year was probably the best year the shingle trade will ever experience, notwithstanding the fact that the last two months were very poor. We think the prospects for 1908 are not very bright. The demand is likely to be slack and prices will rule lower in sympathy with the prices of other commodities. The production is likely to be large on account of easier labor conditions, and a plentiful supply of cars will keep the Eastern market overstocked. The value of cedar stumpage is likely to advance, so that the cost of manufacture will not decrease very much. The new Eastern rate on shingles will, in our opinion, curtail shipments. Generally, we think this year cannot result in much profit to the shingle manufacturer, but next year should be a good one if we are blessed with a good crop.

Prices of B. C. Logs.

Logging conditions in British Columbia have improved during the past month, as practically all the cheap logs of November, December and January have passed into the hands of those who can hold them and there are very few camps in operation except those having contracts, so that prices are better and logs can all be sold, although at not much more than half the price of a year ago. The following are quoted as prices for logs at present, delivered, all charges paid: Fir of good average quality, \$7 to \$8 per M.; cedar of good average quality, \$8 to \$9 per M.; spruce of good average quality, \$8.50 to \$9.50 per M. It is hoped that the lumber business will improve to such an extent in the near future that most of the logging camps will resume operations. Of course, labor being so much cheap-

er, makes it possible to log for 25 per cent. less than logging operations cost during the first nine months of last year.

Lumber Activity on Kettle River.

Great advancement is now about to be made in the lumber industry on the north fork of Kettle river. At present plans are under consideration by strong eastern companies which will revolutionize matters on the North Fork river. The fact that the British Columbia Government have prohibited any more staking of timber lands has considerably increased the value of the timber limits already secured. The Kettle Valley line railway already completed to Lynch Creek, a distance of 20 miles, will, when completed to Franklin camp, next fall, furnish transportation facilities for all the available lumber on the extensive limits. The North Fork river itself, a good drivable stream, can carry the logs to any desired point. The extension of the Government wagon road to Franklin camp this year will furnish additional facilities for the opening up of these timber limits.

It is the feeling of the public that the Provincial Government should assist in every way this great industry. It has been estimated that there is at least five hundred million feet of good saw timber between Grand Forks and Franklin camp. Most of this timber is white pin, fir, tamarack and spruce. On several of these large groups of limits big saw mills will be erected this spring, giving employment to scores of men. Grand Forks will come in for its own share of the prosperity of the north fork, as it is the natural supply point for all the northern timber camps. The continued high price of lumber is acting as a strong stimulant for the mill owners pushing forward in this profitable industry.

Current Trade Conditions

ONTARIO.

A better tone is gradually creeping into all branches of the lumber market in this province, although the volume of business is still not large. Inquiries have been noticeably numerous of late, although actual sales are still not numerous. Factories are buying somewhat more freely, but only according to their needs, although they give evidence of a desire to lay in a portion of their customary annual stocks within the next few weeks. From the country yards there are still only feeble signs of trade revival. The heavy storms of the past couple of weeks have so completely blockaded the roads throughout the country that there is little chance of much teaming being done till the spring thaw comes. In the meantime country buyers are sorting over stocks preparatory to laying in meagre supplies for an uncertain summer's trade.

Comparatively little change has been made in the price situation, although some hemlock has changed hands at rather attractive prices, it being reported that some stocks have been sold as low as \$13.50 at the mill. This, we find, is for material that the vendors have special reasons for parting with. Some of the small mills have also sacrificed their stock in fear of a falling market, but, on the whole, prices remain strong, many holders refusing to consider anything under \$16. Pine is quite firm, with the exception of lath, which is very uncertain in price. The call for shingles promises to assume more interesting proportions in the near future. The late "drop" in price

was in reality merely a settlement of the fluctuating rates which had been prevailing since the fall. These prices are now as follows: xx, \$2.75; xxx, \$3.60; xxxx, \$3.82, and xxxxx, \$4.15, f.o.b., Toronto.

EASTERN CANADA.

The situation with regard to the British lumber market shows but little change for the better. Ordinarily at this season of the year it is generally possible to forecast the conditions likely to prevail on the other side. At present, however, there is no large selling by provincial shippers nor any demand for large purchases by British importers. Both sides appear to be playing a waiting game. Prices are better than they were some time ago, but are still some ten shillings below the price which prevailed at this time last year; this is far deals shipped by the winter steamship lines. It is pointed out that the money market in England is easy, but there is some fear that the business depression in the United States may have its effect in the old country this year and decrease to some extent the building trade. While local shippers are not making large contracts, on the other hand, there is a fair market for lumber offered locally. It is held by many that there will be a considerable advance in prices in the spring.

Shingle prices hold firm and even higher rates are anticipated for cedar extras. The latter are now quoted at \$4.10 to \$4.25 for Boston delivery. Clears are quoted at \$3.60 to \$3.70. Lath is less firm.

WESTERN CANADA.

Trade in the West at this time last year was exceptionally good, owing to the fact that many new lumber yards in the Prairie Provinces were opening up, stocking heavily and making abundant preparations for a good year's trade. Later, however, with the season's crop and financial embarrassments, difficulty was found in holding stocks through a sudden prolongation of "hard times." During the past few months there has been a slow adjustment of accounts and dealers are only now beginning to get down to a working basis.

Trade also is brightening rapidly in Western Canada. Large enterprises are being pushed ahead at a considerable expenditure of capital and will set the pace for private undertakings. On the coast the interest of the industry is centred largely on the question of the Government's timber policy. Wise Government legislation would do much at the present time to give stability to the British Columbia industry.

UNITED STATES.

Inquiries for white pine are reported to be as numerous in the Chicago market as at this time last year, although the tendency is to hold off as long as possible before sending in orders. Buffalo reports state that white pine is selling at a fair rate and the trade seems holding its own. Yellow pine is showing a gradual improvement on orders, but it is generally conceded that it will take from six to eight months to bring the market back to normal.

A revival in the demand for hemlock has been noticeable, following the resumption of building operations. The country yards are beginning to buy moderately for immediate use, but are not stocking up as heavily as usual. New

York building has been too slow to permit of any increase in hemlock demand, as local stocks continue large enough to handle the small amount of new trade offered. In Buffalo there has been some price shading in sections of \$1 and less.

In hardwoods factory buying is the principal feature of the market. Inquiries from furniture factories and manufacturing concerns are coming in frequently and have led to the transfer of some small quantities of stock. Prices at Buffalo for almost all lines are firm, although the demand is still of dwarfish proportions.

GREAT BRITAIN.

The position of the spruce market at west coast points remains extremely satisfactory, due principally to the firm attitude of Canadian shippers who, so far, have sent over only small consignments which have been quickly dealt with. The imports for the past month have been considerably less than at the corresponding period last year, while the consumption has not proportionately decreased. Stocks are, therefore, becoming reduced, and prices are bound to stiffen. With regard to stocks, says "The Timber Trades Journal," there is ample of all sizes with the exception, perhaps, of 2 1-2 x 7 in., especially 14 to 15 feet lengths; 3 x 6 in. are also scarce and at present are within a few shillings the same as 3 x 7. Spruce boards are almost non-existent, stocks consisting of 4 and 5 in., while of these there are none too many.

The market for Quebec pine deals is firm, and although the demand is only moderate, values indicate no sign of any reduction. Birch planks are steady and give no indication of weakening. Holders of stock will realize more money for their holdings of this material a little later on. Fresh arrivals of birch logs are meeting with a ready sale and full values are being obtained.

THE NEWS

Beauchemin & Neault, lumber dealers, Three Rivers, Que., have registered.

It is stated that A. Leclerc, lumber manufacturer, of St. Lucien, Que., has assigned.

J. J. Libbey, lumber dealer, of Fort Saskatchewan, Alta., is reported to have assigned to S. H. Smith.

Holmberg & Company, lumber manufacturers, Winnipeg, Man., are reported to have assigned to Matson & Ackland.

R. Scaffé's planing mill was damaged in a recent fire to the extent of \$3,000. The greater loss was to the machinery.

The North American Land & Lumber Company, Limited, have sold their mill and limits at Fernie, B.C., to a syndicate of American capitalists, who will operate it under the name of the Eastern British Columbia Lumber Company.

A despatch from Grand Forks, B.C., informs us that preparations are under way for the development of a large timber area in Kettle river valley. Several big saw mills will be erected this spring between Grand Forks and Franklin camp.

Nineteen hundred and eight promises to be a good building year in Vancouver, B.C. The permits issued there during January, the duller month of the whole season, totalled over \$350,000 and established a record for the month which it is thought will stand for a number of years.

It is announced that the Grand Trunk Pacific line will almost certainly be completed as far as Edmonton during the coming summer. Every preparation is being made to rush construction, and an effort will be made to surpass the world's record of railway building established by the company last season.

L. K. Jones, Secretary, Department of Railways and Canals, Ottawa, will receive tenders up to March 20th for the supply and delivery of British Columbia or Douglas fir timber required for the Rideau canal. Specifications can be obtained at office of superintending engineer of the Rideau canal, Ottawa.

It is generally understood that the sale of the Alliance Insurance Building, Montreal, which is assessed at \$300,000, and valued at nearly half a million, is about consummated. The new owners are reported to have the intention of pulling down the building and erecting another on a more pretentious scale.

Tenders are being taken by the city clerk of Vancouver, B.C., for the construction of the sub-structures of the new bridges over False Creek, at Westminster avenue and Granville street; also for the wooden trestle approaches to the Granville street structure and the embankment approaches to the Westminster avenue structure, and for the construction of a temporary bridge over False Creek at Westminster avenue.

Logging operations are being resumed after the mid-winter close down by several prominent camps in British Columbia. Several weeks ago the steamer Sechelt took up a full crew from Vancouver for Weston & McClary's camp at Sechelt Inlet. Since then another batch of men have gone up on the same steamer to Frolander's camp, also on Sechelt Inlet. All the large camps in that vicinity closed down before Christmas.

The Patrick Lumber Company, Limited, of Nelson, B.C., at the time of writing have most of their mill frame up and their hand saw in position. They are putting on a large staff of workmen next month, so as to have the mill completed by the first of June. "Waterous" machinery is being installed. It is said that this mill will be one of the most up-to-date in British Columbia and one of the largest in the interior of the province, having a capacity of 125,000 feet per day of 10 hours. The head office of the company is at Nelson, B.C., and the plant is situated at Crescent valley, an ideal mill site.

Rupert G. Haley and Thomas Bell, St. John, N.B., liquidators of the A. L. Wright Lumber Company, Limited, are asking for tenders up to March 17th for the timber lands, timber, mill, camping outfits, horses, wagons and other general effects of the concern. The timber lands are

situated on the Coverdale river, in Albert County, N.B., and consist of 9,463 acres granted lands, and 830 acres farm leased lands, a total of 28,465 acres. The mill was erected at a cost of \$30,000, and is replete with electric lighting plant, telephone line, workmen's houses, stores, barns and outhouses, all the buildings being wired and lighted by electricity. There are about three million feet of logs in stock.

There is considerable speculation as to the value of the estate of the late Timothy Lynch, the lamented Miramichi lumberman, whose death recently occurred so suddenly. Mr. Barry, Judge of Probates, will be unable to act in this case in his usual capacity, having been appointed an executor of the estate under the will of Mr. Lynch, whose solicitor he was for upwards of twenty years. The value of Mr. Lynch's estate is very difficult to arrive at, owing to the fact that his death occurred at a time of the year when he was in the middle of his lumber operations, which are carried on under the joint stock company name of the Timothy Lynch Lumber Company, Limited. It is estimated that the amount will be about \$150,000.

The Waterous Engine Works Company, through their British Columbia representative, Hugh B. Gilmour, have received an order from the Nicola Valley Lumber Company, of Canford, B.C., for a complete planing mill outfit, including planers, matchers, moulders and all running gear. Cowan woodworking machinery will be supplied. The same company have also received an order from the Fernie Brick Company, of Fernie, B.C., for a 100 horse-power Waterous engine and boiler, to be installed in their new plant. Mr. Gilmour states that the millmen in the interior are nearly all putting in the new Waterous patent upper guide for band saws. This is considered one of the best of recent improvements in band saw machinery.

In the Supreme Court at Ottawa there is now in progress a case of some interest to the trade in the appeal of Rioux vs. St. Lawrence Terminal Company. In 1893, the appellant bought a lot of land in Lake Matepedia seigniery, Quebec, for the purpose of becoming a settler thereon and farming it. The land formed part of certain timber limits held in fee by the company, and in the deed to Rioux there were reservations made as to the banks of the lake and tributary streams, water powers, mines and quarries. By a third reservation the purchaser was prevented from cutting or removing any timber except for building, fencing and firewood. Under the reservation the company after moving the merchantable timber, claimed the right to all other timber standing or lying on the land and proceeded to cut it and take it away, in doing so passing over land which had been cleared by Rioux. The appellant then brought an action for damages and an injunction against the removal of such timber as might be needed by him for building, fencing, and firewood. On the construction of the deed, the action was dismissed by both courts below. On the appeal it is claimed that on a true and reasonable construction of the deed, the appellant was entitled to succeed, and that if the reservations amount to absolute prohibition they are contrary to law and ineffective.

National Wholesale Lumber Dealers' Association to Meet.

A number of interesting subjects will be taken up for consideration at the annual meeting of the National Wholesale Lumber Dealers' Association, at Washington, D.C., on March 4th and 5th, and indications at this time point to a good attendance. The program will include reports on credits, arbitration, legislation, railroad and transportation, fire insurance, forestry, terms of sale, etc., and it is expected that other subjects will be introduced which will make the meeting a very interesting one. Special arrangements have been made with the hotel for the accommodation of members and already a number of room reservations have been made, and it is urged by the Association that members or their friends anticipating attending should order their rooms as far ahead as possible, because the hotel is crowded at all times. There are a number of good hotels in the vicinity, known as the Shoreham, Raleigh, Arlington, Abbott House, etc.

The committee in charge of the banquet is perfecting its arrangements and it is expected that an unusually good list of speakers will attend.

The retail and wholesale associations will be represented by delegates.

Forest Systems of France and Japan.

In France the forest mountain regions were in the way of complete denudation before 1860. Their mighty sponges of roots, deciduous deposits and undergrowth which regulated the flow of the streams, were exposed and dried, and on taking fire were destroyed. Heavy rainfall washed away the disintegrated mountain soils which filled the river beds and checked navigation. Productive land became barren. There was a dearth of lumber. Cities with large manufacturing interests were punished with torrential floods, or drouth, and the punishment increased recurrently. The French Government at last bestirred itself and appropriated \$15,000,000 to purchase 400,000 acres of the deforested area. For over forty years it has incurred an annual expenditure of \$600,000 for reforestation, and plans are on foot to acquire an additional tract at a cost of \$20,000,000. While the state-owned lands of France will remain unproductive for many years, the plans promulgated are deemed wise and of eventual profit.

The forests of Japan have been managed by the imperial government for many years. The national forests of that country cover an area of about 30,000,000 acres, or slightly more than half the total forest area. The management of these forests by the Japanese Government has proven successful and profitable.

Mexican Lumbering Enterprise.

At Madera, Mexico, the Serra Marde Land & Lumber Company, headed by Col. W. C. Greene, is building the largest sawmills in the world. The plant is to consist of two mills of 250,000 feet capacity each per day and will be capable of putting on the Mexican and American markets 150,000,000 feet of lumber annually. One of these mills should be in operation by March next. The company owns 2,564,000 acres of land, the greater part of which is heavily covered with the finest pine timber in the republic. The company is already turning out 85,000 feet of lumber daily from two small mills.

About sixty miles from Nueva Casas Grandes on the Rio Grande, Sierra Madre & Pacific Railroad, another American company has acquired 180,000 acres of timber lands, and is preparing to build a railroad from that point to the tract and erect sawmills.

In the last few years practically all of the pine timber lands any way accessible to railroads, built or projected, have been brought up by Americans to the extent of nearly 60,000 acres.

Paper Made From Peat.

The latest substitute for wood for paper and which is already being manufactured in Sweden, backed by London capital, but under an American patent, is peat. Peat makes only coarse paper, but it relieves the demand for wood pulp. This is likely to cause the development of the large peat deposits in Canada and the United States.

BRADSTREET'S

Capital and Surplus, \$1,500,000.

Offices Throughout the Civilized World.

Executive Offices:

Nos. 346 and 348 Broadway, NEW YORK CITY U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.

Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, judiciary and business corporations. Specific terms may be obtained by addressing the company or any of its offices. Correspondence invited.

1908 ?

YES, we are optimists and have the utmost confidence in 1908. We have increased our facilities for supplying "QUALITY" SPRUCE of superior grade and the finest possible mill work. We are now in position to take care of either straight car business for FLOORING, CEILING, PARTITION, NOVELTY SIDING, NEW BRUNSWICK CEDAR SHINGLES, LATH, etc., or thoroughly mixed cars of the above. Our facilities for this business are unequaled anywhere. If you wish small quantities of various varieties we can serve you as well as on straight car shipments.

We have built up our trade to its present large volume through uniformly fair treatment of customers and close attention to the quality of our products. We believe that "Quality is the best policy." Our customers believe it also. It means to them satisfied trade, larger profits, increased business, and the satisfaction of always handling the best of its kind. The time when any old thing would do has passed. Now people want things right. They feel with us that "Quality is the best policy." If you do not know the meaning of "FENDERSON QUALITY" you will do yourself a favor by trying "Quality Policy" and Stock.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are
Johnson's Horse Liniment No. 1.
A penetrating Alcoholic Liniment. Put up in one gallon jugs, with full directions, per imperial gal. \$4.50

Johnson's Horse Liniment No. 2.
A combination of the best oils used as liniments, imp. gallon . \$3.00

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic. Imperial gallon \$5.00

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . \$2.25 or in 1/4 lb tins, per dozen . . \$3.50

Johnson's Condition Powders. (Concentrated). Put up in bulk, per lb . . . 30c. These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.
In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating liniment, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to \$100.

Send postal for printed matter.

This Saw Stands Without a Rival

AND IS THE
FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. On receipt of 40 cents we will send one by mail.

We are the only manufacturers in the world who export Saws in large quantities to the United States.

We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOODWORKER is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., the CANADA LUMBERMAN AND WOODWORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO - - - MARCH 15, 1908 - - - MONTREAL

Ontario's Crown Lands.

The government of Ontario is taking steps to preserve the provincial forests and to encourage reforestation. In a recent speech Premier Whitney intimated that the government intended to deal with the forestry question in a practical manner. Two important steps have already been made in this direction by the introduction in the Legislature of amendments to the Lands Act and the Forest Reserves Act. By the former provision is made for the inspection of lands prior to their being opened for settlement. In future townships will be examined and if adapted for the growth of timber rather than for agriculture, settlers will not be admitted. Another important measure in amending the Forest Reserves Act provides that "in case of timber being damaged by fire, or reaching matured growth," it may be sold by public auction. These two bills now await their third reading.

A still more difficult problem, however, must yet be faced by the government in dealing with the forests. Prior to 1892 a number of licenses were granted giving births practically in perpetuity. Some of these are already nearly half a century old and have been since in cases repeatedly transferred. More recent licenses have included the stipulation that timber must be removed within a specified time. The older perpetual licenses have been declared a hindrance to settlement and to reforestation. In view of this fact it is probable that the government will have to adopt some means of reinvesting in the Crown land held under licenses issued prior to 1892. The Crown may, therefore, have to inspect the various berths so held and devise some means of recovering the licenses, either by fixing a period during which timber must be cut, or by giving the licensees a cash indemnity for resigning their holdings. By this means, it is said, the Crown will secure the return of hundreds of acres of forest now held by license in the northern portions of the province and will arrange for the taking over of tracts of land in old Ontario capable of growing white pine in perpetuity. It is understood that a start will be made in the carrying out of this policy during the present session of the legislature, when a bill will be put through authorizing the sale of matured lands on forest reserves under regulations that

call for the exercise of great care in the handling of debris. Trees suitable for cutting will be so designated by a qualified forester. The estimates provide some \$45,000 for fire ranging on forest reserves.

Must Look for Demand.

Salesmen of many years' experience say that these times are peculiar in one way at least. While the demand is light, still it is there, and by careful, painstaking work it may be unearthed and landed. Again they say that the salesmen who take business at the going market rate is in better condition to take advantage of any rise in the market than is the man who says there is no market, or who states that he does not care for the business at the price. The one who pushes right along seems to succeed in getting a few orders all the time.

Lumbermen's Organizations.

Amongst lumber dealers, those in older Canada particularly, there is a peculiar dearth of local organizations such as those state and national associations, which have been of so much assistance in advancing the welfare of the industry in the United States. At the periodical meetings of these bodies trade matters of great importance come up for discussion. The lumberman learns the views of different people and can always profit by the experiences of his competitors. Besides pure business discussion there is also opportunity given for the cultivation of the social side and the extension of desirable trade connections. Dealers of undesirable trade habits can be discussed and ostracized and a higher standard of business practice maintained.

It is scarcely necessary to point out that this is an age of co-operation and combination of interests. In every successful line of business it may be noted that the people interested are working together to obtain for the trade the best results. There is only one way of bringing about this result, that is, by competitors meeting together and discussing on a common ground the questions in which there is a mutuality of interest.

The need for a Canadian national association has been mooted more than once. Early this month there was held in Washington the annual convention of the National Wholesale Lumber Dealers' Association. Representatives were present from all parts of the country and every effort was made to arouse interest in the meeting, and an unprecedented attendance was the result. In Canada neither for soft nor hardwood is there an organization solely for the active lumberman. On the Canadian Manufacturers' Association he has no representation, although his right to a position thereon needs no demonstration. While other industries have their associations, which meet at stated intervals for the discussion of matters of trade interest, lumbermen have thus far made no attempt to establish such. This is not as it should be.

Prairie Timber.

The idea has been more or less prevalent in Eastern Canada that our prairie provinces furnish very little timber of a marketable nature, and those who have never traveled through the middle west are more or less skeptical regarding statements to the effect that any appreciable quantity of lumber is actually being manufactured in a country which has been long presumed to be treeless. Those who in the early days journeyed through Manitoba and the then territories tell us that the timber growth at that period was confined to a few scrubby trees bordering the streams which had in some way escaped the devastating prairie fires of the days when the Indian roamed at large over the boundless west. Since the systematic settlement of that vast district tree planting has been practised in liberal fashion. In the pioneer days the farmers set out windbreaks about their homes and these, in some instances, have now become miniature forests. Moreover, in direct proportion with the growth of settlement the ravages of fire have decreased. The growths along the streams have been steadily flourishing and the results of this tree cultivation, if the term can be applied to such desultory methods as man has thus far made, are really remarkable. Instead of being a treeless waste our prairies are more and more lending themselves to the operations of the lumberman.

The Tables Turned.

"Mill men are no longer forced to bump the floor with their foreheads, while humbly begging the timber magnates for a long time from which to fashion a few toothpicks," says a British Columbia exchange.

"Please cut our logs and save our financial lives, kind Mr. Millman, moan the aforesaid timber magnates. We need the money, and those fellows across the line refuse to let us unload on them, now that we cannot get the titles they asked for.

"And the price of logs is down, and likely to go lower yet. Then the refusal of the Government to extend the timber licenses for a period of twenty-one years has assured the Coast mills of a supply of good logs at reasonable prices, has been proved anew by some of the recent developments in the lumber business. The speculators who have been tying up all the available timber with the expectation of making a big turnover have had to call a halt. The financial magnates who were depended on for the sinews of war have expressed a dissatisfaction with the terms of the present titles, and are very chary of putting their money where there is such an uncertainty as to just how they would get it out again.

"An example of this is contained in the experience of a certain gentleman who is reputed to have invested something like a million dollars in British Columbia timber limits. Had the Government granted the extension that was so lobbied for, this speculator could have rested on his oars without the necessity of clearing off his timber until such time as the mills would have been forced to "see" him. As it is now this same party has been forced to approach the mill owners with the proposition, that they take up the work of cutting enough of this timber to carry the rather heavy work of financing such large holdings, and the logs will reach the mills at a price that will save several dollars per thousand feet to the consumer. There is little doubt but that many others will be forced to take the same methods, and already the mill owners report that the tide has turned, and that from now on there is little doubt of their getting all the logs needed at much less than last year's prices.

"A prominent mill owner remarked, 'These holders of timber limits are falling over themselves to get us to cut enough of their timber to clear them of the royalties, and enable them to get their money out of the business. I would not be surprised, he continued, if this action on the part of the Government is the beginning of a distinct revival in the lumber business all over the Coast, and such material reduction in the cost, as will greatly stimulate the building trades both of the province and the Northwest.'"

B. C. Shingle Market.

James A. McNair, vice-president of the Hastings Shingle Manufacturing Company, also president of the McNair-Frazier Timber Company, Vancouver, B.C., in a recent interview stated that the mills of British Columbia manufacturing shingles expect to begin operations this month, after having been shut down about four months. He said that trade is opening very slowly and a busy season this year is not to be expected. The mills will have to hold tight and the men keep together to even hold the market at a reasonable profit.

"We have set prices for the Canada market at 25 cents lower than last year," said Mr. McNair, "which would be a \$2.40 basis for the standard shingle and for clear cedar shingles \$2.62. We handle the shingle business there in a very nice way, having two selling companies which take care of about 90 to 95 p.c. of the total cut, which was about 3,500,000 to 4,000,000 daily last year, making an approximate output of between 700,000,000 and 800,000,000 at an average value of \$2.65. These two selling companies are the sole agents in Canada for the above percentage of mills. About 65 per cent. of the cut goes to the Canadian market and about 35 to the American."

Australian advices to "The Financial News," London, state that Canadian paper manufacturers are making strong inroads at all centres in the Commonwealth. If the standard of quality of the paper is maintained there will be a strong preference in favor of the Dominion's product against that of the United States. Wall paper manufacturers are also finding a good market.

Money Situation Saving Forests.

The tightness of the money market during the past year, and more especially during recent months, will have a direct beneficial effect upon the conservation of our forests. The rapidly growing demand from all quarters that there should be more stringent laws regulating lumbering operations, and especially the export trade, will almost certainly crystallize into some sort of remedial legislation within the year. Those who have seen most clearly the need of such legislation were powerless to prevent the wholesale destruction of our forests, which is still being carried on by a few lumbermen. But what they could not do the scarcity of money is doing. Construction work of all kinds has been greatly curtailed, and the demand for lumber correspondingly lessened, and many of the lumbermen have themselves felt the pinch and have been unable to operate this winter on so large a scale as they had intended. Fortunately they will gain and not lose by this enforced restriction of their business, for were the cut this winter as large as was intended the market next season would be glutted with lumber, that there was not money to purchase. But to those who are not financially interested in the lumber business, anything is welcome that keeps the axe and saw from the tree, and many years of the most approved forestry methods could not replace the trees that would have been destroyed this year, had money been plentiful.—"Canadian Forestry Journal."

Poles Scarce in Western Canada.

The Winnipeg correspondent of the Western Electrician writes that a scarcity of telephone poles is liable to hinder construction planned for Western Canada this summer. The British Columbia Lumber Company, the Yale Lumber Company and the Shuswap Lumber Company, all of which supplied poles to the Alberta Government last year, say they have been obliged to refuse orders for over half a million poles, and are of the opinion that considerable difficulty will be experienced in filling these orders. Representatives of the Manitoba, Saskatchewan and Alberta Governments, as well as the representatives of several American companies, are said to be in British Columbia seeking poles. It is expected that fully three times as many poles will be required in Western Canada this year, as were in demand in former years, while to add to the scarcity the Grand Trunk Pacific Railroad Telegraph plans an active construction campaign, which includes the installation of a telegraph line between Fort William and Edmonton, a distance of approximately 1,300 miles. In addition the other railroad companies will string a large amount of new wire this summer.

The two varieties of wood in chief demand in Western Canada are tamarack and British Columbia cedar, but conditions are now such that those requiring poles are not over particular about the kind of wood, provided the measurements come up or close to the required standards.

New Ontario's Tie Industry.

A despatch states that the rush on the Duluth Extension has commenced and a train load of ties is being brought into Port Arthur daily. It is expected that in the course of a few days shipments of ties will be in full swing and that more of this material will be put on the road. Owing to the lack of snow a comparatively small quantity of ties has been hauled to the track as yet, only the contractors who have short hauls being able to make delivery at the track. It is estimated, however, that the road will be busier than ever this spring, as the contractors have all had a good winter, and every one has taken out large quantities.

Important Lumber Merger.

A great lumber merger is announced from Winnipeg, under which five big companies with an aggregate output of three million feet and a capital of ten million dollars, will amalgamate. The companies are the Red Deer Lumber Company, the Elk Lumber Company, the Sunset Lumber & Timber Company, the Yale, Columbia Company, and the Bowman Lumber Company. They have seven complete outfits, including several of the best mills in Western Canada.

Model Box Making Plant*

BY FRASER S. KEITH, B. Sc.

The plant of the Consumers Box & Lumber Company, Limited, is unique in many respects. First of all the main building is designed on the one floor principle, having no uprights in the interior area of the main floor. All shafting is placed underneath and the machinery, belt driven from below. The power house is in a separate fire proof building. A complete exhaust system is part of the equipment, by means of which

pine, while the pillars supporting these are 12 x 12 inches, Georgia pine. As the building was erected these uprights were put in perfect alignment, and the bearings bolted thereto with 14-inch bolts. These bearings are only seven feet apart. The shafting is 50 per cent. heavier than ordinarily placed for wood-working machinery, in order to give high speeds desired. Two main lines of shafting run across the building driven by 16-inch D.K. McLaren belts, each transmitting 140 h.p., while a smaller shaft runs along the length of the building, transmitting 110 h.p. The belting used is extra heavy and has never been tightened, nor required any attention since installed. As the shafting is situated about four feet from the floor it is easy of access and little trouble is exper-

CONSUMERS BOX AND LUMBER CO.—VIEW FROM EAST END.

shavings and refuse are taken directly from the machines to the boilers.

This concern is in reality subsidiary to the Parry Sound Lumber Company, with which it has some of its officers in common, the president of the company is Mr. J. B. Miller; Secretary-Treasurer, W. P. Levack; and General Manager, F. Sully.

On the main floor may be seen one of the largest single spans, with-

inced in oiling the bearings. The friction load has been found to be very light, owing to the perfect alignment of the bearings, the heavy supports used and the entire lack of vibration.

POWER PLANT.

The power plant building situated near the main building, and from which a shaft is run into the basement, is of brick, steel and con-

CONSUMERS BOX AND LUMBER CO.—SHOWING SHAVINGS PIPING SYSTEM IN BASEMENT.

out supports, in Canada, containing an area 214 x 64 feet, with no uprights to mar the view of the superintendent, who can tell at a glance what is going on in the entire process of manufacture. The building is supported on heavy concrete foundation with concrete floor in the basement, the beams supporting the main floor are 12 x 14 inches, Georgia

crete 60 x 50 feet, 22 feet high. The power installation includes a Brown automatic engine 18 x 54 inches running at 70 r.p.m. with a 16-foot fly wheel. The Brown engine is manufactured by Polson Iron Works, of Toronto. Two boilers are installed, with room provided for a third, each of approximately 125 h.p., manufactured by Polson Iron Works. The feed-water heater and feed-water pump were supplied by the same firm.

*By Courtesy of "The Canadian Manufacturer."

The electric light plant, consisting of a high speed engine and generator was installed by Jones & Moore, Toronto.

Situated in the basement, on concrete foundations, is a Sheldon & Sheldon double 60-inch fan driving the exhaust for the shavings. There is also a 50-inch fan for saw dust. A complete system of piping is included, connecting with every machine. All shavings, saw dust and refuse are conveyed by means of these from the manufacturing floor to a hopper, situated on top of the power plant. The refuse from the mill is

where it is planed on both sides. The capacity of this machine is from 15,000 to 25,000 feet, depending upon the thickness of the lumber going through. There are three of these machines. After being planed the lumber is taken to cut-off saws, which are arranged across the factory. Of these there are five cross-cuts and five rip-saws, manufactured by both Canadian and American makers. After being sawn to the proper lengths and widths the pieces are received by one of two matchers, which have a feeding capacity of 160 feet per minute. One manufactured by

CONSUMERS BOX AND LUMBER CO.—VIEW FROM EAST END.

fed into furnaces automatically, by means of this system, and practically all the fuel used is refuse from the factory. Two large fire proof vaults are situated adjacent to the boiler room, provided with fire doors and in these are kept shavings and saw dust.

MANUFACTURING FLOOR.

The manufacturing floor presents an interesting spectacle as from any point thereon may be seen what is taking place in the entire plant. It also makes it easy to follow the process of manufacture from the

Cowan & Company, of Galt, and the other by the Morgan Machine Company, of Rochester, N.Y. Having passed through the matchers, the work is delivered to a shook assembler, where the pieces are forced together making two or more capable of being handled as one piece.

If the box is required to be printed the pieces are taken from the shook assembler to the printing room. This printing room is kept dust proof, being situated in the east end, where are to be found two large printing presses, and a great variety of steel and brass type. One of these is a cylinder press, manufactured by the Morgan Machinery Company, Rochester, N.Y., being a double color machine. It has a capacity of 3,000 pieces per hour. The other press is manufactured by the Prouty Printing Press Company, of Boston, and is one of the largest of its kind in Canada. Steel and brass type are used exclusively, of which there is a large variety of both kinds. The capacity of this machine depends entirely upon the operator. Both machines are operated by power from pulleys underneath.

From the printing machines the pieces are taken to the lock corner or nailing machines, depending upon the style of package called for. The lock corner machines have a capacity of from 8 to 10,000 boxes per day. They are manufactured by the Morgan Machine Company, and cut both ends at the same time. From the lock corner machine the parts go to the setting-up machine, which forces the ends and sides together after being locked cornered. They then go to the trimming machine, where the corners are smoothly trimmed. The next operation is nailing. There are seven of these machines, also made by the Morgan Machine Company. These machines are almost human in their action, and will drive any number, from one to sixteen nails at a time, in sizes from one to three inches in length. When the nailing machine is through with it we have a finished box.

The boxes are taken either to the north side of the building, where there is a siding running the entire length of the factory, and shipped by rail, or the south side where shipping doors are located for delivery by drays to the city.

SPECIAL FEATURES.

No material is carried by hand in the factory. All lumber, no matter in what stage of manufacture, that requires transporting from one part of the factory to the other, is loaded on easy running four wheel trucks that are found to give very satisfactory service. They were manufactured by Taylor & MacKenzie, of Guelph, Ont.

The main floor foundations are so strong that the floor has a carry-

CONSUMERS BOX AND LUMBER CO.—VIEW OF PRINTING PRESSES.

rough lumber to the finished box. The manufacture of a box calls for a large amount of machinery and requires more skilful handling of the material than the average person would imagine.

At the west end of the building lumber is received and is passed through a band resaw, made by Conell & Dengler, Rochester, N.Y. This is a heavy machine with a capacity of 40,000 feet of lumber per day and will resaw four boards out of a one inch board. From there the material goes to a double surfacer, manufactured by Cowan & Company, of Galt,

ing capacity of 2,000 tons, and in spite of the fact that there is a large amount of heavy machinery operating at high speed, there is absolutely no perceptible vibration.

Every machine is equipped with its own exhaust, so that there is no dust, nor shavings, nor saw dust on the working floor of the mill. This combined with the fact that it is particularly well lighted, makes an attractive factory for the men employed.

The heating is accomplished by exhaust steam from the engine. Incandescent lights are installed for any artificial light that may be required.

The factory management is worthy of notice, the superintendent has entire charge of the plant, and may see at any one time what is going on in any of the departments. He is responsible to the general manager for the work turned out and for the general operations of the plant. Under him are three foremen, each in charge of a different department. These departments are: (1) Resaw and planing; (2) cutting department and (3) making up department.

Above the main floor is situated the filing room, where a complete outfit is installed to take care of band saws and circular saws.

The factory is situated in the new factory district of Toronto, north of Dundas street bridge, the premises are bounded on the south by Ernest avenue, on the north by Wallace avenue, Perth avenue, on the east, and the Canadian Pacific Railway and Grand Trunk Railway on the west.

The factory is connected to the railroads by an 800-foot siding.

The property contains five acres.

About seventy-five hands are employed.

The amount of property enables the lumber to be kept at a distance of 100 feet from the factory, giving a low rate of insurance. The yard capacity is from six to eight million feet of lumber. It is laid out in parallel lines with 14-foot roads running east and west and north and south.

The general manager, Mr. Sully, has had 25 years' experience in the manufacture of boxes, which include everything from cigar boxes and jewel cases to the very largest packages required for shipping. The factory is under his direct supervision.

Trade Opportunities.

The following trade inquiries for wooden goods have been received recently, by the Department of Trade and Commerce, Ottawa. Addresses of firms may be had on application to the CANADA LUMBERMAN.

Barrel Staves.—A Scotch firm desire the names of Canadian timber merchants, with a view to obtaining prices of whole and half barrel staves for hhd. barrels. The timber must be close grown.

Barrel Staves.—Well known fruit agent and importer of London, England, wishes to hear from Canadian manufacturers who can export staves for Spanish grape barrels, delivery to Almeria, Spain. Made of any wood excepting oak or pine.

Box Boards.—A Manchester firm seek prices and sizes of box boards as ordinarily cut in Canadian factory, and would welcome samples.

Bored Boards for Brushes, Broom Handles, Dowels, Chair Legs.—Well known manufacturer's agent in London, England, with large connections, is open to act as selling agent for Canadian manufacturers of the above lines. Can do an extensive business for regular shippers. Broom handles to be of standard quality, 51 by 1 1-8, made of basswood or pine; dowels, 5-8 by 14 1-2; chair legs, maple, beech or birch, 16 3-4 by 1 1-2. This is a good trade opportunity and the party making the enquiry has good references.

Broom and Brush Handles.—Well known Birmingham, England, firm are in the market to purchase handles of various sizes and qualities from Canadian manufacturers, who can make regular shipments. References.

Broom and Implement Handles.—Old established Lancashire handle wholesaler, with good connections, is in the market for all kinds of handles and is open to receive quotations from Canadian firms who can do export business.

Broom Handles.—A Manchester firm wish to get prices of maple broom handles, 50 by 1 1-8 inches, from Canadian manufacturers.

Brooms.—A South African firm of wholesale general merchants

desire to be placed in touch with Canadian manufacturers of 3-tie and 4-tie brooms.

"Fitups."—A London firm are open to purchase supplies of "fit-ups" suitable for umbrella sticks in beech, birch and maple, and invite quotations from Canadian manufacturers.

Handles.—A Liverpool firm asks for prices and descriptions of pick and hammer handles from Canadian manufacturers.

Handles.—Principal of London, England, firm of manufacturers' agents, who will be in Canada during April and May, wishes to get in communication with manufacturers of any description of handles suitable for European market. The firm can place very large quantities, and is anxious to meet Canadian suppliers who can give regular shipments of well graded goods.

Manufacturers' Agent.—Reliable manufacturers' agent in Paris, France, is anxious to act as exclusive representative of commission agent for Canadian firms who can export wood products of various kinds. Good references and wide connection. This party thinks that Canada should be able to extend her trade as a result of the recent French treaty.

Manufacturers' Agent.—Well known, long established firm of manufacturers' agents in London, England, are open to represent any Canadian exporters of wooden goods, who are interested in the British market. Good references and wide connection.

Maple Blocks.—Midland's Company are open to purchase supplies of maple last blocks and invite quotations in carload lots, from Canadian manufacturers.

Maple Rollers.—Offers for immediate shipment of good, sound quality, maple blocks for mangle rollers, are invited by an English firm of importers.

Maple Roller Blocks.—A Keighley, Yorkshire, firm invite offers from Canadian shippers of maple roller blocks, in the usual standard sizes for clothes wringers and mangles.

Pine Doors.—A Hull firm ask Canadian manufacturers of pine doors to state their lowest price for shipment.

Oak Scantlings.—A Hull firm, importing large quantities of oak scantlings, inquire into the prospect for securing shipments from Canada of this material for making of wheel spokes.

Lumber.—An Egyptian firm ask for the names of Canadian exporters of lumber.

Pine Sidings.—A Lancashire firm desires prices of pine siding, first, second and third quality, from Canadian exporters.

Pulp Wood.—A Manchester firm, with extensive connections, would correspond with Canadian exporters of pulp wood.

Representative.—A well established London firm, having agents in various parts of the world, are anxious to get in touch with Canadian manufacturers of wood pulp, who require representation.

Representative.—An Irish firm desire to represent one or two first class firms of Canadian shippers and lumber manufacturers. They desire to make contracts for parcels and cargoes for waney and white pine timber, red pine, spruce and pine deal boards, floorings, etc. Firm will give bankers' references.

Round Birch Dowels.—A Midlands manufacturer of furniture invites quotations from Canadian manufacturers for the supply of round birch dowels, 7-8 to 1 inch.

Timber.—A Dutch firm is desirous of getting in touch with Canadian exporters of timber.

Wood Pulp Boards.—A Manchester firm desire to obtain c.i.f. prices of wood pulp boards, from Canadian manufacturers.

Wood Goods.—An old established Belfast firm of wood brokers, desire an agency for the sale in Ireland of Canadian wood goods.

James Harrison—Wholesale only.

James Harrison of Burlington, Ont., announces that he has disposed of his retail lumber and planning mill yards at Hamilton and Burlington and will in future conduct a wholesale business only. Mr. Harrison has also been appointed sales agent for Ontario for Messrs. Robert Stewart, Limited, of Guelph, manufacturers of doors, sash, trim and house furnishings in pine, hardwoods and veneers.

THE WOODWORKER

Building Window Frames.

By W. C. A. STEVENSON.

The making of an ordinary window frame is a very simple piece of work, but when it is desired to build a window frame and lay out the opening in the building to receive it so as to make a perfectly windproof job, it will require a little extra skill and more accurate calculation on the part of the workman. It is too often the case that not enough care has been taken with the making and setting of the frames. In new houses I have seen wind enough come in around the windows to blow out a lighted match. This is a condition for which there is no excuse, and is due to pure carelessness on the part of the workman or the party in charge. The details shown herewith are designed for a roughcast or frame building, and if carefully followed will produce a good tight job.

The special features of this frame are: First, the blind stops, instead of being the ordinary 7-8 inch by 1 1-2 inch, are 7-8 inch by 4 1-2 inch, and are allowed to meet the sheathing boards on the centre of the

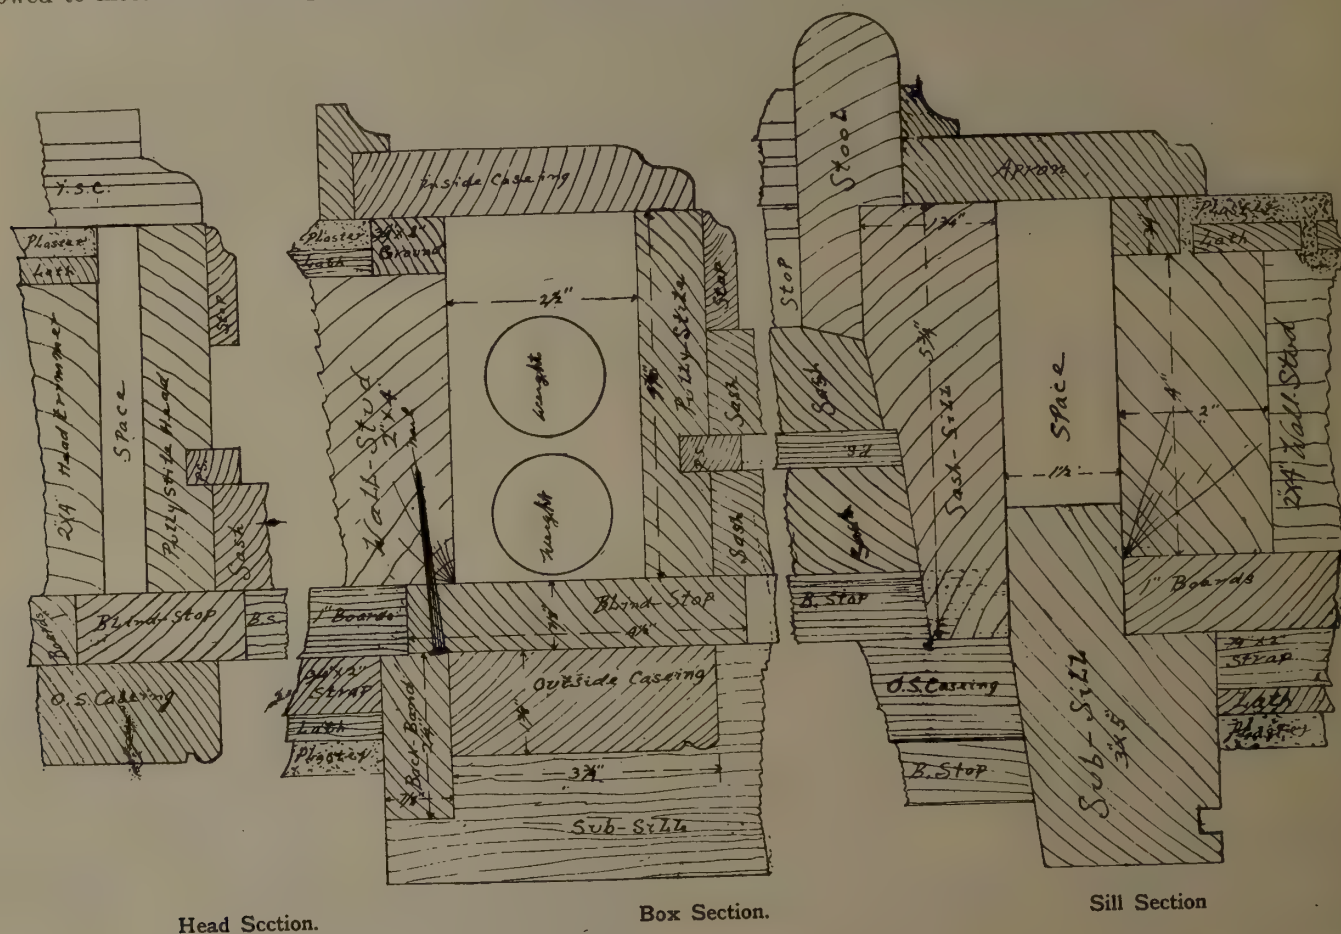

would be given a slight pitch to form a drip over the head of frame, or, which would be still better, put a piece of galvanized iron over the top and allow it to extend up, say 2 inches, behind the strapping. This will prevent any water from working in behind the frame.

Third, the bottom sash and the stool on the inside of window are beveled to fit together, as will be seen at the box section. This makes a perfectly tight joint, and the moment the sash is lifted it frees itself.

U. S. Forestry Service Making Tests of Lumber.

It is doubtful if any of the laboratories maintained for Government scientific research are more unique in character, and yet bear promise of more important results, than one which has just been established in Washington by the United States Forest Service for investigating the structure of commercially important woods.

Laymen will not understand the significance of the proposed investigations carried on in this laboratory so quickly as architects, build-

Head Section.

Box Section.

Sill Section

wall stud, as seen in the box section. Care must be taken to frame the opening in the building the exact width, which is 11 inches wider than the width of the glass, made up thus: 4 inches for wood on sash, 2 inches for pulley stiles, and 5 inches for boxes for weights. The opening must also be made perfectly plumb. Then, by holding the sheathing boards 3-4 inch back from the edge of the opening on the sides and top, the opening is ready to receive the frame. The blind stop on head need be only 2 1-2 inches wide, as there does not require to be a space left for weights on top (see head section).

Second, the sub-sill has a corner cut out of it to allow it to drop over the opening instead of resting on top, thereby breaking the joint, as seen at sill section. The opening would be 11 3-4 inches higher than the glass, made up as follows: Sills 3 1-4 inches, 7 inches of wood on sash, 1 1-2 inches frame head and space. The backband should not be put on until after the frame has been set into the building, as by this method you can get good nailing through the blind stop into the wall stud, as seen at the box section; then the back-band can be put around, thus making another break in the joint. The piece of back-band across the head

ers and other wood users, who in these days of growing scarcity of the more valuable woods are seriously perplexed in identifying substitutes. Mistakes of this kind in identification have, in the last few years, in several instances, meant the loss of thousands of dollars, and many embarrassing law suits.

Nearly any user of lumber can recognize, and name off-hand, all the usual trees of the forest when he sees them growing, and not much difficulty is encountered in identifying the common kinds of lumber in a mill yard because he knows the few trees from which the yard lumber comes. But common kinds are growing scarce, and woods not often cut heretofore, are appearing in the markets. The most experienced men are sometimes puzzled when they try to identify them, and persons with less experience have still more trouble. Is a certain wood, gum or elm? Is another cucumber, linn, or poplar? Is a stick sugar maple or red maple? Doubts may arise whether a piece is hemlock or spruce, or whether it is lodgepole pine or fir, or whether a shingle is cypress or cedar. A dealer may buy red oak and suspect that he is getting something else. There are thirty or more important species of oak. The

best lumber dealer might not know which is which in the lumber pile, or if he knows, he might not know how to prove it.

Many of these woods look alike, even to the trained eye of the millman or the builder, and yet they are widely different in value for certain purposes, and it is of the greatest importance to be able to distinguish them quickly and certainly. Again, a new wood may come to a man's notice for the first time, and it may be necessary for him to decide what it is and what it is worth.

The Government has been helping individual lumber users for some time, but the facilities have not been nearly so complete as they are now. It is to meet such needs and answer such questions, that the Forest Service has established the laboratory, and placed it in charge of a trained dendrologist. Architects, lumbermen, manufacturers and makers of woodware are already sending in samples of wood for identification, and asking if there are not some structural characters by means of which such woods may be conveniently separated for relative species having greater or less value for some specific purpose.

The laboratory will investigate in a practical way. The structure of the woods, sections lengthwise and crosswise, will be studied so as to separate by structure along the various species of a genus. Analytical keys to the trees of each group will be worked out. These will be based on the arrangement and character of the pores discernible to the naked eye, or by a hand lens.

The results will be published from time to time with good illustrations and placed at the disposal of lumber users. After all the important groups of wood, such as oaks, pines and firs, have been studied and the results published separately, the several monographs will be collected and published in one volume.

A work of this character has long been in demand by architects, builders and other users of lumber. It will, in most cases, enable even a non-technically trained man to determine quite readily the wood he deals with by means of an ordinary hand lens and by comparing the wood in question with the photographs of cross and long sections given in these monographs.

Canadian Woodworkers' Journal.

There is before us the initial number of the "Canadian Woodworker," a new monthly journal for workers in wood. The publication is attractive typographically and presents in concise form considerable information of a practical nature. The publishers, Messrs. Biggar-Wilson, Limited, Confederation Life Building, this city, are to be congratulated on the excellence of their production, which will doubtless meet with deserved success at the hands of the Canadian woodworking industry.

A Familiar Sign.

Passengers on the Grand Trunk Railway coming out of Montreal see many signboards of interest. However, the one that appeals most

to the saw mill man or to the man whose business has to do with lumber is that in the St. Henri suburb in a big field directly back of the Simonds Canada Saw Company's Canadian factory. The sign reads, "SIMONDS SAWS MADE HERE," and a big hand points toward the factory. The illustration which we show here represents the signboard and the

Simonds factory as it appears from the railway track. The long rollways seen extending out of the upper storey of the buildings are used in the manufacture of band saws.

"Tower" One-Man Two-Saw Trimmer.

The illustration of the "Tower" one-man two-saw trimmer which appeared on page 24 of our issue of February 15 was not, we regret to say, an up-to-date representation of that machine. It was an old cut

THE "TOWER" ONE-MAN TWO-SAW TRIMMER, AS NOW CONSTRUCTED.

and did not show the trimmer in its improved form. We are illustrating the present model herewith. It will be noted that it is provided with iron legs, and that the facilities for removing the saws are of the best.

To Make a Venetian Blind.

An Irishman out of work applied to the "boss" of a large repair shop in Detroit. When the Celt had stated his sundry and divers qualifications for a "job" the superintendent began quizzing him a bit. Starting quite at random, he asked:—

"Do you know anything about carpentry?"

"Shure!"

"Do you know how to make a Venetian blind?"

"Shure!"

"How would you do it?"

"Shure, I'd poke me finger in his eye!"

A Profitable Investment.

Some people are always looking for outside investments. They put money into things they themselves know nothing about. They entrust it to entire strangers, who may or may not be honest and capable. Sometimes they receive dividends, oftener they do not. And while they are playing the other fellow's game on the one hand, on the other their own business is perhaps suffering from lack of capital, or offering excellent opportunities that are unimproved. As a rule, there is no safer or more profitable investment for one's money than in one's own business. Frequently there is a chance to add greatly to the profits by making a small outlay in additional or improved machinery or appliances. For instance, in some cases mills are hauling off their sawdust or burning it in the open air and using slabs and edgings to run their plant, notwithstanding that there is a good local market for fire wood. Again, it not infrequently happens that mills do not cut more than 90 per cent. as much lumber as they should because the steam pressure sometimes gets down.

In either case the Gordon Hollow Blast Grate is claimed to be a big dividend earner. The manufacturer's claim that some users report that it pays for itself every month. Just think of it! A profit of 100 per cent. a month! 1,200 per cent. a year! And not for one year but for many years. The Gordon Hollow Blast Grate Company, of Greenville, Michigan, authorize us to say that they will ship an outfit subject to thirty days' trial, and that they will stand the freight both out and back in the event of rejection. Certainly this is a proposition worth looking into.

The largest wooden building in the world is, said to be, the Parliament buildings at Wellington, New Zealand.

Market Correspondence

Contracting in Ottawa Valley.

Ottawa, March 10, 1908.—The most important recent event in the lumber industry in this district was the sale by J. R. Booth of all his three-inch deals to be cut in 1908 to Messrs. Cox & Burstall, who have purchased his output for many years past. While there is much speculation as to the terms, and conflicting statements are being made about the prices obtained, it is understood that the contract shows a reduction on the higher qualities of deal from last year's figures, which of course were high compared with quotations in the past. On some grades, however, it is said that there was no advance. It is believed the buyers have not yet closed any contract for thin lumber. In some quarters it is said that producers of the Georgian Bay district have definitely promised a reduction, and it is expected that Ottawa manufacturers will have to do likewise. Still several manufacturers here assume a firm attitude and contend that there is no reason for reducing their quotations of 1907. In the first place, they have greatly curtailed the winter cut of logs, and they state that the season overhead has been expensive for taking out logs. They are two weeks behind the average year on account of the heavy snow, and double the usual number of teams may have to be employed in some places. The W. C. Edwards Company have not yet sold their 1908 cut, but it is learned that the Hawkesbury Lumber Company, like J. R. Booth, have accepted the offer of the British buyers, deals only being sold in that case also.

A prominent lumber dealer, who has just returned from England, told the CANADA LUMBERMAN that the demand over there was much smaller than in previous years. He reports building trade very dull. Prices in Sweden and Norway, which countries supply a large market in England, were lower, and there was great anxiety shown by agents from those countries to sell for forward delivery.

The total number of men employed at J. R. Booth's mills next summer will be over 2,000, or a little more than last year. There will be an increase of 100 men on account of the sulphite mill now under construction, which will be operating by the first week in June. There might be a few more men working in the paper and pulp plants also, but the main lumber industry has already been enlarged as much as possible and cannot grow much more. The other and more recent industries which Mr. Booth has started, paper, pulp and sulphite, have a better chance to grow. Complaints have been made by various people, says Mr. Jackson Booth, in an interview that men employed at the mill get only seven months' work in the year and are then turned adrift. But together with the men employed in the new plants there are now as many men employed all the year round as were employed altogether by Mr. Booth a few years ago. In reply to a query as to the export of sulphite, Mr. Booth said:

"We have not at present any intention of manufacturing sulphite for export. We will simply manufacture it for consumption in our paper and pulp plants, where a large quantity is needed. Indeed we expect the sulphite factory to be such a saving to us that we are losing money every day its construction is delayed."

A complaint by the International Trades and Labor Council that the Sabbath observance law was being violated by the shunting of logs on Sunday in Booth's yard is denied emphatically by the lumberman.

The ever-advancing price of pine, especially the middle classes, is improving the prospects for spruce and hemlock trade in this locality. Hemlock remaining firm at from \$14 to \$16 mill run, culls out, is regarded as very significant when some years ago not more than \$6 a thousand was available. Hemlock has been sent from Ottawa to the New York market at as high as \$20 a thousand, which convinces local men that it is becoming greatly used as a substitute for pine. For building in Ottawa and vicinity hemlock and spruce has also been eagerly sought.

Regarding a statement recently made by Mr. J. F. Whitson, of the Surveys Branch of the Department of Lands and Forests of Ontario to the effect that within twenty years a pine famine would be suffered

unless precautions were taken to limit the cut, a prominent Ottawa lumber merchant said he thought the statement rather exaggerated.

"If accurate knowledge could be obtained as to the exact amount of white pine now standing," said the lumberman in question, "it would be possible to form an estimate as to the length of time which the pine would last at the present rate of consumption, and whether there was any danger of a timber famine. Present estimates, however, are formed chiefly on guess-work. I think, too, that Mr. Whitson had not taken into consideration the relief furnished white pine by other varieties, such as spruce, hemlock, North Carolina pine and yellow pine. I think that on the whole Mr. Whitson's is a far-away cry."

Mr. William Anderson, manager for J. R. Booth, said he thought that Mr. Whitson had colored matters somewhat highly and thought that there was little danger of a timber famine if the forests were properly protected.

Driving Preparations in Eastern Canada.

St. John, N.B., March 9, 1908.—Lumbering conditions in the lower New Brunswick counties have changed materially since last writing. In this particular section, there has been a considerable fall of snow. There is now good hauling in the woods and operators are making the most of it, to get the results of their winter's logging operations to within easy distance of the streams. In the more northerly sections there is little change. Conditions are still favorable and the indications are that all logs cut will be browed before the hauling fails.

The condition of the shingle trade and the prospects in that regard are attracting much attention from local manufacturers. Few transactions are being made either in low or high grades. There is little indication at present of a weakening in the prices of high grade when business opens up again, although buyers are somewhat shy of the high figures which prevailed when the busy season came to an end last fall.

That the markets held up under the heavy shipments of last fall, is taken as an indication that, when the early spring trade begins, similar figures will again be current. Local people have taken full advantage of the high prices and have shipped up their high grade shingles until there are very few left in stock at any of the local yards. Reports from outside districts tell of similar conditions. It is many years since "Extras" and "Clears" were as scarce as at present, at this time of year. Two millions of "Extras" and one and one-half millions of "Clears" would be about the quantity, and this is considered practically a clean-up. To secure any of these it is probable that buyers must bid from \$3.15 to \$3.25 per thousand for dutiable "Extras," and from \$2.65 to \$2.75 for dutiable "Clears," f.o.b. schooner, St. John.

The provincial trade in cedar shingles is very promising. This line of business calls mostly for low grades; the more expensive shingles being little in demand. A remarkable phase of this end of the trade is the scarcity of "2nd Clears." The trade in this line, within the prov-

Always in the Market for Mill Cuts

Always for Sale

149 Broadway, NEW YORK

ince, promises to be very heavy, and dealers are in a quandary as to how to meet the demand, which is sure to come in great volume during April and the three following months. This line of shingles retailed last year at \$1.85 per thousand, the shingle being an excellent one for the price, the result was practically a general clean up. It is doubtful if more than a million "2nd Clears" are to be had in this city. "Extra No. 1's" are more plentiful and the demand in this line is not apt to exceed the supply. Between six and seven millions would be the proper figures to use in figuring the stock of "Extra No. 1's" on hand at the local yards. The indications are that the latter brand will retail at \$1.00 per thousand, while the price of "2nd Clears" will no doubt soar from ten to fifteen cents per thousand.

The prospects for the manufacture of cedar shingles during the coming season are not of the brightest. The late starting of the mills will affect the output materially. Also, the winter's cut of cedar logs by local manufacturers promises to be somewhat lighter than usual, although, if the stream driving season should prove to be a successful one, there will no doubt be sufficient raw material to keep the principle manufacturing plants in cut from mid-May till the end of the season. Few cedar logs are being wintered at the local booms.

Miramichi Cut Greatly Reduced.

On the Miramichi, as on about all the other rivers of New Brunswick, on which extensive lumbering operations are carried on, there is a great reduction this year in the cut. Last year there was in the vicinity of 180,000,000 feet of logs cut on the Miramichi and its tributaries for the various lumber and pulp companies doing business in that section of the province. Of the amount named above, about 140,-

000,000 feet was manufactured into long and short lumber, while the remainder was handled by the pulp and paper companies. This year there is an increase in the amount which will be used by the pulp and paper companies, as practically the entire cut of 35,000,000 of the International Paper Company will be shipped to the United States for manufacture into pulp, and about 55,000,000 feet will in all be used by the pulp and paper companies.

The total amount of logs coming out of the Miramichi this year, however, will be only about 110,000,000 feet and only about 55,000,000 of that amount will be manufactured into long and short lumber. Of the pulp companies the heaviest operator, by far, is the International Paper Company, which on the Richard's and Hutchinson properties is taking out between thirty-five and forty million feet, about all of which will be manufactured into pulp. The Miramichi Pulp & Paper Company and the Dominion Pulp Company, the two companies having mills on the Miramichi, are taking out about ten million feet each.

On the southwest Miramichi there is a decided reduction in the cut of the lumber companies. The Timothy Lynch Company, which usually cut upwards of eighteen million, will have only about four million feet this year, Michael Welch also having reduced his cut to three million feet. On the Bartholomew the Alexander Gibson Railway & Manufacturing Company will take out only about five million feet this year. On the northwest Miramichi, Hon. Allen Ritchie's cut this year is only about seven million feet, while Hon. J. P. Burchill has reduced his cut to three million feet. The Sinclair's cut on the northwest Miramichi will be between six and seven million feet, it is stated. On the Tracadie and other tributaries, the Snowball Company will cut about fourteen million feet, while James Robinson ex-M.P., on the Dungarvon and Renous Rivers will cut about five million feet.

MISCELLANEOUS

AUCTION SALE

— OF —

VALUABLE TIMBER LIMITS, SAW MILL,

Plant, Supplies, Mining Lots, Logs, &c.

— OF —

THE EAST TEMPLETON LUMBER COMPANY, LIMITED.

There will be sold by Public Auction, at the Russell House, in the City of Ottawa, on Tuesday, the 15th day of September, A.D. 1908, at 2.30 o'clock p.m., by THE EAST TEMPLETON LUMBER COMPANY, LIMITED, the following Timber Limits, Real Estates, Saw Mill, Mining Lots, Plants, Supplies and Logs in transit, namely:—

Parcel Number 1. "Coulange Limits," comprising 156 square miles of Timber Limits on the Coulange River in the Province of Quebec, covered by Licenses Numbers 149, 150, 151 and 152 of Season 1873-74 and known as Berths W, X, Y and Z, together with certain Limit Plant, Supplies and Live Stock to be sold therewith.

Parcel Number 2. "Hibou Limit (Gatineau)," comprising 20 square miles of Timber Limit on Hibou and Ignace Creeks covered by part of License No. 550 of Season 1873-74, together with certain Limit Plant and Supplies to be sold therewith.

Parcel Number 3. "Wakefield Limit (Gatineau)," comprising 8 square miles of Timber Limit in the Township of Wakefield covered by License No. 58 of Season 1873-74.

Parcel Number 4. Several Freehold Timber Lots in the Township of Wakefield.

Parcel Number 5. "Black and Dumoine Rivers Limit," comprising 26½ square miles of Timber Limit on the Black and Dumoine Rivers covered by part of Licenses Number 362 and 369 of Season 1873-74 together with certain Limit Plant and Supplies therewith.

Parcel Number 6. Real Estate, Saw Mill, Lumber Yard and Wharf at East Templeton. This parcel consists of about 208 acres more or less of Freehold and 5 acres of Leasehold land at East Templeton, P.Q. (about 8 miles below Ottawa on the Ottawa River), together with a fully equipped Saw Mill and Machinery erected thereon having a capacity of 150,000 feet per day, with Lumber yard, Wharf, Railway siding, Cars and other plant and machinery therewith.

Parcel Number 7. Mining Lots. This parcel consists of several mining lots and mining rights in the Townships of Wakefield, Buckingham, Portland East, Portland West and Derry.

Parcel Number 8. A large quantity of logs, timber, telegraph poles and ties now lying in and about the Ottawa, Coulange and Gatineau Rivers at and in transit to the above mentioned Saw Mill.

The first seven parcels above mentioned will first be offered for sale en bloc, subject to a reserved bid fixed by the Vendors. If the reserved bid is not reached, then each parcel will be immediately offered for sale, separately, subject to a reserved bid fixed by the Vendors.

Full particulars and complete descriptions of the respective parcels and the terms and conditions of sale will be made known at the time of sale and may be seen on application to the Vendors at East Templeton, P.Q., or to their Solicitors, Messrs. Gormully, Orde & Powell, No. 33 Sparks Street, Ottawa

FOR SALE

White Pine Canadian Timber Limit

IN DISTRICT OF ALGOMA, ON THE Canadian Pacific Railway, and tributary to Georgian Bay. Virgin Pine of large size and superior quality. Estimates and price will be furnished by owners on application. Address Box 577, CANADA LUMBERMAN, Toronto.

Annual Forestry Report

The annual report of the Superintendent of Forestry, R. H. Campbell, has been submitted to Parliament. It is a comprehensive review of the work accomplished last year, and is a valuable addition to the forestry literature of the continent.

The number of timber berths granted during the past year was 49, totaling an area of 410.6 square miles, and the amount received on account of bonuses was \$226,360.45, being an average of \$511 per square mile. It is satisfactory to note that recent sales of timber are yielding much larger average prices than have been received at any previous time.

The report says: "The present method of disposing of timber is, however, not a satisfactory one. The department has, as a rule, little or no knowledge of the timber of which it disposes, and as the quantity now in private hands is fully adequate to meet present needs, no detrimental result would follow the holding of timber lands until Government inspectors can examine and estimate the timber, so that an adequate upset price may be fixed before a berth is put up to competition.

"The necessity for fuller knowledge of the timbered districts is emphasized continually by the experience of the department, and it would be a proper policy for the department to obtain directly more adequate information in this respect. The inquiry made by a committee of the Senate during past session showed that the natural resources of the northern districts of the west are greater than the public had any idea of, but the evidence would be much increased in value if direct means were taken by the Government to obtain information in regard to these districts, and, as a result, the administration of the timber therein could be more intelligently carried out."

Current Trade Conditions

ONTARIO.

Although the volume of orders placed in Ontario during the past fortnight has not varied materially from previous weeks, there has been a brighter tone to the market and a greater number of inquiries from rural yards, which presage a considerable increase in business by April 1st. Among builders the impression is that it will be June before structural operations are in full swing, although there is no doubt that an early and promising spring will do wonders in reviving trade, particularly in the country, where so much depends on the crop prospects. Country yards have been buying so little that it is almost impossible for them to fill what small orders are coming to them and from these inquiries are coming. They know that they must have lumber soon and are trying to buy to the best advantage. This will mean the shipping of a good deal of material at an early date.

Quoted prices of pine and hemlock are questioned on account of the rates at which some material has been sold. There has been no official drop in price and the big dealers are holding firmly to past quotations, but the idea is abroad that pine and hemlock must come down and reports of odd lots bought cheaply encourage retailers to hold off. It is rumored that within the past week yellow pine has weakened again and if such proves to be the case, there is little doubt that a good deal of this material will find its way into Canada. It is said that the Ottawa Valley mills have been placing considerable stocks of white pine in Western Ontario. The Northern

Ontario mills are determined, however, to adhere to past rates. They claim they have held up during a trying winter and see no cause for doubting the market at this stage of the game. Much will depend on the action of retailers during the next few weeks.

EASTERN CANADA.

In the eastern provinces interest is centered principally in the hauling of logs to the streams in anticipation of the breaking up of the ice. The cut has been curtailed in almost every section and a comparatively small quantity of lumber will be manufactured during the coming season.

The demand for spruce is not active and indications point to the lapse of some time before prices reach a sound level again. In New York there is little or no market for cargo shipments, retailers having nothing beyond old contracts in view. Concessions are the general rule on all orders placed.

Eastern cedar shingles are in good condition. The demand is moderate, but stocks are small and prices firmly maintained. The mills are asking \$4.10 to \$4.25 for the best cedar and \$3.50 to \$3.60 for clears for the Boston market. Lath are in small demand and values far from firm.

WESTERN CANADA.

Coast mills are hampered in their operations by letters coming in daily from farmers, contractors and other consumers in the prairie provinces, asking that they be supplied with lumber direct. When the cut in prices was decided upon a few weeks ago it was thought that the trade with the northwest,

which has been flat for many months past, would revive somewhat. Travelers, however, were unable to get orders, as the retailers will not buy until they dispose of the lumber bought when the prices were high and they threaten loss of business to any mill that sells direct on the new basis of prices. Now that such changes have occurred in the local log situation mills are practically assured of a good class of logs at lower prices and have shown an inclination to meet the situation by a reduction in prices. The retailers always control the situation, as with no import duty on lumber they can hold up the threat that they will buy from Washington mills.

UNITED STATES.

In the Chicago market, trade in hemlock promises to be active judging by the number of country inquiries dealers are receiving. In New York, on the contrary, it is hard work getting retailers to consider hemlock buying, although quotations on large orders are shaded somewhat. Prices are not in satisfactory condition.

Inquiries for pine are also encouraged and prices are being better maintained. The increase in the number of orders is not particularly noticeable. At Buffalo, white pine is moving slowly.

The resumption of operations by a large number of hardwood manufacturing concerns throughout this section has had a stimulating effect on the market. The demand for white and red oak in both plain and quarter sawed is better than has been the case since last summer. Hard maple is being bought by the flooring factories for immediate use only.

GREAT BRITAIN.

The Liverpool spot market for Quebec pine deals is firm for lower

grades, but for higher grades the position is not so good. Complaints are frequent of the general slackness of business, but there is an undesirable scarcity of orders for Quebec pine. Consumers state that the wood is not worth the prices asked and look for a drop in price. Stocks are just now particularly low in the lower grades and what is in stock is being firmly held, but there is little or no demand for the higher grades and stocks, generally speaking, are ample.

Values of birch planks are unchanged, but show a tendency to stiffen, if anything, as stocks are generally becoming depleted, with very little fresh material arriving. Logs are being firmly held, especially if fresh and well manufactured.

In the spruce market there is very little life and orders are coming in in a very desultory fashion. Such small arrivals as reach Liverpool are sold from the vessel's side on private terms.

A Campbelltown, N.B., despatch states that the cut on the Restigouche this season is between fifty and sixty million feet; it would probably be nearer sixty than fifty million. The Shives cut alone will be between twenty and thirty million. The cut is larger than was expected, largely due to weather conditions. The scarcity of snow prevented the lumbermen from hauling as easily as usual. They were yarding for three weeks at a period when they were usually hauling. One operator alone got out 1,500,000 feet more than he expected on that account. The men are now hauling as fast as possible.

Indications point to an early opening of the river and it is probable that driving will be begun somewhat earlier than usual.

WICKES BROTHERS
Saginaw - Mich.

THE NEWS

John Gauthier & Company, lumber dealers, D'Israeli, Que., have dissolved.

The Fraser Davidson Lumber Company, Limited, Moose Jaw, Sask., have obtained a charter.

A new mill is to be erected at Dalhousie, N.B., by the St. Lawrence Lumber Company, of Three Rivers, Que., at a cost of \$150,000.

Mr. Robert Hamilton, of the Robt. Hamilton Machinery Company, Vancouver, has returned from a month's trip to Eastern Canada.

The Imperial Shingle Company, Limited, Vancouver, have erected a new office building near their mill and their business address is now corner of spruce street and Sixth avenue, Vancouver.

A new wooden bridge will be erected this season at Deer Bay Creek, near Peterborough. Reeve Brown, of North Monaghan, is chairman of the Roads and Bridges Committee of the Council Council.

Robt. Hamilton & Company, of Vancouver, report the sale of a 60 inch by 16 foot Goldie-McCulloch boiler to A. Urquhart, of Comox, B.C., for installation in his mill at Cumberland, Vancouver Island.

J. D. Moody, manager of the Vancouver Lumber Company, Limited, and Vicegerent Snark, for British Columbia, of the Hoo-Hoo, has returned to the terminal city from a several months' visit to his old home in Texas.

S. Cunard & Company, Halifax, N.S., will receive tenders up to March 16th for the cargo of the "Affezione" now lying at the dry dock and consisting of 704 M. spruce lumber, 1 by 3 to 1 by 11, shippers, and 51 M. spruce lumber, 1 by 3 to 1 by 11, seconds.

The Alberta Lumber Company, Limited, Vancouver, have added to their power equipment by the installation of a 350 horse-power Atlas engine, and a 72 by 16 boiler. They have also installed a 16 x by 30 McGregor-Gourlay timber sizer and a Berlin band re-saw.

A terrible accident occurred at Dodderidge Station a short time ago. While engaged at his work at the mills, an employe named Reader, an Englishman of 40 years, was caught up by the machinery and literally sawn in two. The unfortunate man left a wife and family.

The False Creek Lumber Company, Limited, Vancouver, report a steady run all the winter, the bulk of their output going to the local trade. They purpose extending the mill building in the near future and also adding another planer and matcher to their equipment.

The C. P. R. have been authorized to construct bridges at or near the following points on their system: Lethbridge, Alta.; Carpenter Creek, B.C.; Mission Branch, B.C.; Bala, Ont.; Thames River, Ont.; Embro, Ont.; Brockville, Ont., and Badger Creek, Man.; C. N. Monserat, engineer of bridges, Montreal.

The Mitchell Machinery Company, of Vancouver, report the sale of two Vulcan Iron Works logging engines, one 10 inch by 12 inch and the other 9 inch by 10 inch, to a new logging company now being organized in Vancouver. They have also secured the order for an aerial tramway, a Pelton water wheel and a Curtis air compressor, to be supplied to the Moresby Island Mining & Development Company.

Among the latest companies to secure a charter are:—Britnell & Company, Limited, Toronto, Ont., incorporated as lumber manufacturers, capital \$40,000, incorporators, W. Britnell, A. E. Britnell, Thos. Reid and C. W. Thompson, all of Toronto; and Bowman-Gray Lumber Company, Limited, Dundas, Ont., incorporated, capital \$40,000, incorporators, J. H. Bowman, A. McL. Gray, M. T. Brown and others, all of Dundas.

Following the announcement just made of the completion of the deal with the Grand Trunk Pacific, a contract will immediately be made awarding the contract for the construction of 100 miles of railway from Prince Rupert eastward at approximately \$8,500,000. The most important feature is that construction work begins this year and is to be carried on continuously until the line reaches the eastern boundary of the province.

Mills at Greenbush, Sask.

The Vancouver Engineering Works, Limited, Vancouver, have added another to their list of agencies, having taken over the agency for the Province of British Columbia of the Graton & Knight Manufacturing Company's leather belting. They have put in a large stock of "Graknight" and "Nepthune" (waterproof) brands, and have a practical belt man on their staff, who will be able to supply belts of all kinds at very short notice.

W. P. Fowle, late manager of the Fraser River Sawmills, New Westminster, B.C., now in partnership with R. E. Nevins, will shortly commence building a large sawmill almost directly opposite the Fraser River mills at Bon Accord. In addition, it is stated that representatives of one of the most prominent lumber and sawmill concerns of Anacortes have been in the city negotiating a site for the erection of a mill on the south side of the Fraser river.

For the second time this year the monthly returns of the building department at Vancouver show an excess over the corresponding months of last year. The February total amounts to \$368,225 as against \$319,220 for last February, an advance of \$49,005. The advance over the 1907 record for the months of the year now stands at \$217,425. Building Inspector Jarrett states there will be no difficulty whatever in rolling up a six-million-dollar total for the present year.

We are in receipt of a copy of a well prepared catalogue, issued by the Cordesman-Rechten Company, of Cincinnati, Ohio, fully illustrating their No. 3 1-2 band re-saw, and showing views of the different parts of the machine. The catalogue further illustrates many of their lines of filing room supplies and treats on brazing and the care of band saws generally. The book can be obtained either from the company's head office or from their local agents, the Mitchell Machinery Company, Vancouver.

Charles Warwick is putting in a shingle mill in the municipality of South Vancouver, about a quarter of a mile from the Cemetery road. The mill is being equipped with "Simplex" shingle machines and Burton saws, and is operated by a 30 horse-power motor. About a mile farther on Mr. Warwick is building a saw mill of 15,000 feet per day capacity for the manufacture of fir, spruce and hemlock. This mill is equipped with a Schaaake circular saw mill and the usual running gear, and will be driven by a 60 horse-power motor. Mr. Warwick also intends to instal a planer.

A despatch from New Westminster, B.C., informs us that the big McDonald-Barnet mills on Lulu Island are being rushed to completion as rapidly as possible, and that both the shingle and lumber mills will be in operation during the coming summer. The framework of the shingle mill is already up and it will commence cutting timber several months sooner than the saw mill. It will contain six machines and will have a capacity of 200,000 shingles a day. The foundations for the lumber mill have been built and the mill itself will be put up right away. Two large dry kilns are being put up in connection with the mills and it is expected that the shingle mill will be in operation early in April.

Notice of motion to quash the Seaman-Kent by-law at Meaford has just been given and some of the moving spirits of this progressive town are now beginning to feel that, after all, this course of action may perhaps be a mistaken one. The members of the company state that when they are in active running order they will employ as many hands and probably more than they have done heretofore. There are now installed in the factory five machines which cost \$3,000 each, and another machine arrived from headquarters quite recently. The company have made arrangements for loading from two to three cars with hardwood flooring every day of each week during the coming season. The agreement calls for the employment of ninety hands. As the local organ points out, it would not be surprising in the light of present circumstances if the Seaman-Kent shareholders should feel that their faith in the honesty and integrity of the ratepayers has been misplaced. To have the report go abroad that Meaford induced a company to rebuild on a promise which the people of the town did not endeavor to carry out will do the town inestimable injury and harm for years to come. The mere mention of such a thing would cause any self-respecting company to think twice before seriously entertaining any kind of a proposition to establish in that locality.

"QUALITY IS THE BEST POLICY"

"Goods Well Bought are Half Sold"

WE do not know the origin of this quotation, the truth of it, however, is thoroughly realized and universally accepted by retailers of all lines of goods.

"WELL BOUGHT" can be given a variety of meanings but the only true definition is—the best value for the least money. Some people believe "well bought" synonymous with "cheapest price" without regard to the value received. This is poor judgment and a disastrous business policy to pursue. The success of our "Quality" policy has proved to our entire satisfaction that the lumber trade of today are fully alive to the benefits derived from handling the very best.

We have by far the best facilities for manufacturing, drying and dressing Spruce, found in Canada. It takes time, money and infinite care to keep our standards at all times up to the required mark, but it pays in the satisfaction of our customers and ourselves.

Our Springfield, Mass., sales office will take pleasure in quoting on your requirements for Flooring, Ceiling, Partition, Novelty Siding, New Brunswick Cedar Shingles, Lath, etc.

DO YOU LACK STEAM? WE CAN HELP YOU.

THE GORDON HOLLOW BLAST GRATE

The most effective device in existence for quickening the combustion of saw mill refuse.

IT SAVES EXPENSE, because you can burn your sawdust and ends of every description under your boilers.

IT INCREASES YOUR OUTPUT, because you are never short of steam.

IT MAKES IT EASIER TO FIRE, because the fuel burns freely and requires a minimum of attention.

IT IS ECONOMICAL—far more so than any draft grate, because the pipe and bars are always filled with a current of fresh air, and so last for many years without requiring repairs.

YOU TAKE ABSOLUTELY NO RISK, because we give thirty days in which to thoroughly test it. In the event of rejection we pay the freight both ways.

Equally efficient in ordinary furnaces or Dutch ovens.—Adapted for any number of boilers.—No change in construction necessary. A hole must be made through the furnace walls for the pipe; aside from this, not a brick need be disturbed.—Can be put in over Sunday.—No difficulty about maintaining a fire at night, when the blower is idle, and no objection to so doing, as the bars are still filled with a current of air, due to natural draft.

Remember, we sell ON APPROVAL.

State how many boilers you have, and whether you have plain furnaces or Dutch ovens, and give width and length of grate surface or surfaces.

We also manufacture the celebrated

"TOWER" LINE OF EDGERS AND TRIMMERS

consisting of forty different sizes and styles.

BUFFALO, N. Y.

Iron Frame "Simplex" Shingle Machine

IN this, our latest design of Shingle Machine, we have incorporated all the advantages contained in our wood frame "Simplex" and added several improvements.

The arbor has been made heavier and a third bearing added to support it outside the driving pulley. The method of putting lead in the saw arbor has been greatly improved. This is now done by swinging on a centre directly under the saw the whole frame which carries the arbor. Thus the alignment of the bearings is not in any way affected and there will be no danger of hot bearings after the lead has been changed. The change may be made while the machine is running and without stopping the carriage.

An improvement has also been made in the method of driving the edger. It is belted direct from a shaft running at right angles to the main arbor from which it is driven by means of a bevel friction. This makes a very neat compact drive and has proved satisfactory in the mill.

The rail on which the carriage travels is made of square steel and when worn can be renewed by simply turning upside down.

Over three hundred of our Upright Machines (wood and iron frames) are in use in British Columbia and Washington.

NEW PATENT MILL DOG

We claim many points of superiority for our Patent Mill Dog, of which One Hundred and Twenty-Five have been sold.

Each mill dog contains ten dogs; six of the dogs have the down-forward motion and four of them the upward motion, so that the log or cant is dogged both on the top and bottom, preventing it from turning its position on the head-block. Even if the log were dogged, not touching the head-block, it would hold the log as well.

It will be seen by the cut that these ten dogs are fastened on the pivot, pin or bolt marked "A" on the cut and connected with link bars from the principal dog to the lever "O" which operates all the dogs.

Fig. 1.

There are five of the dogs which project more than the others, about two inches from the head block, and called the log dogs; and five which project about $\frac{3}{8}$ inch from the head-block, and called the board dogs; but when dogging a board or a plank or a stock, all the dogs come evenly out of the head-block, about $\frac{3}{8}$ inch so that in dogging a board or a stock, both the log dogs and board dogs grip it, providing that the stock or board is wide enough to take all the dogs.

This patent mill dog will dog perfectly safe in all classes of timber, be it pine, hemlock or hardwood of any description, and besides it does not tear the board or stock.

If You Need an Edger
BUY

THE "TOWER"

Front view of "TOWER EXTRA" 36" and 42" Edgers, New Model. Rear Table not shown.

There are a DOZEN EXCELLENT REASONS why you should do so. The limited space at our disposal prevents our stating them all. Some of them are as follows:

1. BECAUSE it is the product of those who for sixteen years have made a SPECIALTY of manufacturing edgers and trimmers.
2. BECAUSE it is kept thoroughly up to date by one of the most severely PRACTICAL designers in the country.
3. BECAUSE there are THIRTY DIFFERENT SIZES AND STYLES, enabling the purchaser to select a machine perfectly adapted to his requirements.
4. BECAUSE the vital parts are all contained in a substantial iron husk resting firmly on the floor.
5. BECAUSE the saws may be taken off without disturbing the arbor. The whole operation is the acme of simplicity.

Manufactured only by

GORDON HOLLOW BLAST GRATE CO., GREENVILLE, MICH.
The largest manufacturer of BLAST GRATES, EDGERS and TRIMMERS in the world.

EXCLUSIVE AGENCY FOR

SIMONDS

Crescent-Ground Cross-Cut Saws

This is the identical Crescent-Ground Cross-Cut Saw which has for years been recognized as the best made or used in the United States. Since beginning the manufacture of these saws at our Canadian factories, we have found and are supplying a greatly increased demand throughout the Dominion. The Saws are made of Simonds Steel, and Simonds Steel is the best saw steel made. They run easy, cut fast and give good results. Sold by the hardware trade or direct from our offices.

Every Saw Covered by an Absolute Guarantee

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other
foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOODWORKER is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., the CANADA LUMBERMAN AND WOODWORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

— APRIL 1, 1908 —

MONTREAL

A Modern Fable.

"Once upon a time there were two men, Mr. Optimistic and Mr. Pessimistic, who made up their minds they would enjoy a day's fishing. They expended a large amount of money for tackle, dug a nice lot of worms, caught some good fat frogs and met on the shore of the lake.

"Mr. Pessimistic said: 'It smells to me a little like rain, it seems to me I can see a cloud over there in the sky, and I tell you right now I am not going to take any chances by going out on the lake until conditions change. The boat might tip over, you know, and then I would lose all of my expensive tackle. Even if the boat didn't spill me out, if it rained I would get wet, if I got wet I would catch cold, if I caught cold I would have a fever, and if I had a fever I would probably die, so I am going to stay on shore until everything is more favorable.'

"Mr. Optimistic said: 'Well, you can stay here, count your worms and eat your frogs if you want to, but I am going out. I have put a lot of money into this outfit. I have got some good fresh bait, and a little cloud doesn't scare me a particle. Suppose we do have a shower, the sun will soon come out, and anyway you would dry off just as quickly in the boat as on shore, besides all that, I want some fish and I am going to have them.'

"All day long Mr. Pessimistic sat on the shore waiting for the storm which never came. His worms dried up, his frogs died, and at night when Mr. Optimistic came in with a big string of fish, he cursed his luck, said everything always went against him, and then teased Mr. Optimistic to divide his fish with him.

"Moral—Simply because Wall Street was foolish enough to get its feet wet is no reason in the world why the entire country should stand still and shiver. Don't scuttle the ship or let the bait dry up. Put on fresh bait, a pleasant look and trust in Providence, but don't forget to throw out your line. No man ever caught a mess of fish who jumped out of the boat, ran up in the woods and kicked a tree. The country was never in better shape than it is this very minute, with 'bumper' crops and good prices, all we need to do is to displace foolish fear with intelligent confidence. Business conditions will again be normal just so soon as the mind of the people is normal."

Canadian Pulpwood Legislation.

On March 12 last a strong plea for the placing of an export duty on pulpwood was made at Ottawa by Mr. E. N. Lewis, of West Huron, who introduced into the House a resolution to the effect "that in the opinion of this House such an export duty should be placed on the export of pulpwood as will be sufficient to induce its manufacture into paper in Canada, and thus save to the labor of Canada the six millions of dollars now lost." Mr. Lewis also suggested that a Royal Commission be appointed to inquire into the whole question. Continuing, he said:

"While pulpwood is a raw material of comparatively low value it produces manufactured articles of high cost. Millions upon millions of spruce logs, hundreds of thousands of cords of pulpwood go yearly from Quebec, New Brunswick and Nova Scotia to feed the pulp and paper mills of the Eastern, Middle and Western States.

"What does Canada get for this?

"1. The Government not \$1 a cord.

"2. The chopper, the loader, the river driver, the teamster, the peeler, not much more.

"3. The railways a low rate on coarse freight.

"The whole result, \$6 or \$7 per cord left in Canada. They don't even allow us to carry the pulpwood in Canadian vessels. I have here a list of fourteen steamships carrying pulpwood last season from Quebec ports to Wisconsin ports, twelve of which are United States vessels, and two Norwegian.

"Watch the value grow afterwards.

"4. Every cord of wood ground to pulp, value \$20.

"5. Every cord of wood made into fibre, value \$30 to \$32.

"6. Every cord of wood made into paper, value \$40 to \$45 and up.

"The resolution asks the Government to take such action as will save to the labor men of Canada the six million dollars now lost annually. I firmly believe twenty millions would be nearer the mark.

"The United States shuts out our finished product, paper, but takes our crude product, pulpwood, makes it into paper and undersells us in Europe with their surplus dump."

Mr. Lewis' suggestion regarding the appointment of a Royal Commission to investigate and report on the entire pulpwood situation is a good one. There is so much diversity of opinion regarding Canada's forest wealth and the future of the lumber industry that any attempt to enlighten those interested would be heartily welcomed. Figures are usually deceptive, but it must be possible to form a fairly accurate idea of the timber area and wealth of the Dominion. The incongruity of some of the statements made in this regard was shown in the reply made to Mr. Lewis by Dr. Beland, member for Beauce. That gentleman contended that it was false to assume that the pulpwood supply of the United States was nearly exhausted and equally false to say that there was any danger of Canada's supplies of timber or pulpwood approaching depletion. If Dr. Beland's correction is valid it is difficult to conceive why there should be any objection to Canada placing an export duty on her pulpwood. The entire subject would be one of secondary importance rather than of the vital interest which it undoubtedly is. It is no false alarm that stirs President Roosevelt to earnestly urge Congress to remove all duty on forest products and to request Canada to do the same.

When the bargaining begins, Canada should keep constantly before her mind the fact that she holds all the high cards. We have the forests and the Americans have the need. That being so, we must not be cajoled or hoodwinked into selling out our advantage for any small price. For instance, it will never do to let the Americans take away our pulpwood or pulp free of duty, either import or export, and then permit them to shut our paper—our finished product—out of their market. Free pulp must certainly be accompanied by free paper. Otherwise we will be simply feeding the American paper mills with our raw material that they may keep our paper, hampered by an import duty, out of their market and compete with it in foreign markets on even terms.

The proper handling of this situation by the Canadian Government should result in transferring the entire paper industry to Canada; for, as we have a monopoly of the raw material, we can command a monopoly of its manufacture.

Building For Speculation or Investment.

The term speculative building usually conveys the impression of unsubstantial structures hastily thrown together. Experience points to the close connection between these two, yet it may well be doubted whether all bad building is speculative or all speculative building is bad. The old adage still applies: "Fools build houses for wise men to live in," implying that sound building is expensive and that those who build for investment must expect disappointment. Those who build costly houses to gratify personal tastes or requirements usually find, when the time for disposal comes that they have to accept much less than the outlay. But to invest money in bricks and mortar is not always a bad investment, nor are all buildings erected by private enterprise for private use unsaleable at a fair price. Good architecture is costly and those who wish the real article must do so with their eyes open, knowing that works of art can never bring their full value if put upon the general market.

The building speculator is generally possessed of insufficient capital to even carry through his building scheme. His object is to turn a small capital over and over as quickly as possible. When the work is finished, his object is to sell immediately, so as to realize the capital which he has invested, such as it is, pay off his mortgages, and pocket such profit as there may be; and then start afresh upon another similar building scheme, and upon precisely the same method. Here is every temptation toward bad building. If he can only sell his houses, he is soon free from all liability for repairs. Trusting to this, he can adopt the flimsiest of construction, which local regulations will permit. He leaves a heavy crop of difficulties to the purchaser; but that, he considers, is not his concern.

The man who builds for investment pursues a very different plan. His object is not to sell quickly and begin afresh, but to build once for all, and either to live in the house himself, or to let it out to tenants, and to treat the rent as income. As a general rule, the property dealt with in this way is of a larger type, consisting of good flats, offices, residences, or shops, the object being to realize a steady income from invested capital. There is still considerable inducement to build cheaply, in order that as large a return as possible may be obtained; but, at the same time, sufficient regard must be had to the future. It thus becomes essential to build soundly, in order that repairs may be avoided, and that the building may be maintained at a minimum yearly outlay, without deterioration for a long period of years. It is also necessary, if tenants are to be obtained, that the arrangements should be convenient, and that the architecture, if not extravagant, should at any rate be pleasing.

Thus there is all the difference in the world between the speculator who builds for the present moment only, and the investor who cares quite as much, and perhaps more, for the future, aiming at a fair return for his capital at the present time, and hoping for a better return in years to come; for there is again this further difference between the two classes—that the speculator chooses only a district where buildings of the description which he is thinking of putting up are likely to sell at present; whereas the investor takes a great deal of trouble to select a site which has, he thinks, a future before it—where, in fact, his buildings are likely to improve rather than deteriorate in value.

Forests and the Water Supply.

In a paper by Mr. W. H. Bréithaupt on "River Regulation with Reference to Ontario Peninsula and the Grand River," read before the Canadian Society of Civil Engineers on the 5th ult., attention was drawn to the relation of the forest to the water supply. The reforestation of about 425 square miles of land in and around Luther and Melancthon townships was one of the suggestions made by Mr. Bréithaupt. He suggested that in addition to reafforestation, large basins or reservoirs should be formed and water stored in these till the season for its greatest need arrived. It was stated that Luther township was nearly all swamp land as late as 1871, so that it lent itself naturally to reafforestation. Within its area there were the sources of several considerable streams.

A Canadian Forestry Exhibit.

Acting under the instructions of the Director of the Canadian Geological Survey, Professor John Macoun began last summer to collect material for a Forestry exhibit for the new Victoria Museum. It is proposed to represent every indigenous species by tree sections, polished deals and photographs. About fifty species were collected last season, chiefly in Southwestern Ontario. The tree sections when ready for exhibition will be four feet in height, cut so as to show the grain of the upper half, the lower portions remaining as the sections came from the tree. The deals will be polished in the usual manner and the photographs framed in wood of the species they represent.

A Lumber Salesman's Symphony.

Here is a bit of philosophy that is worth any salesman's while reading and remembering. It was written by Edwin Osgood Grover:—

"I believe in the goods I am selling, in the firm I am working for, and in my ability to get 'results.' I believe that honest goods can be sold to honest men by honest methods. I believe in working not waiting, in laughing not weeping, in boosting not knocking, and in the pleasure of selling goods. I believe that a man gets what he goes after, that one order to-day is worth two orders to-morrow and that no man is down-and-out until he has lost faith in himself. I believe in to-day and the work I am doing, in to-morrow and the work I hope to do and in the sure reward which the future holds. I believe in courtesy, in competition. I believe there is an order somewhere for every man ready to take one. I believe I'm ready—right now.

Has Discouraged Timber Speculation.

"I believe the provincial legislature is aiming at the eventful preservation of timber for those only who are bona fide manufacturers," said Mr. H. Youdell, the veteran timber broker of Vancouver, B.C., recently. "Recent legislation appears to me to have been passed for the purpose of doing away as much as possible with speculation in timber, and on the whole I believe that all legislation that has been passed has been, on the whole, in the interests of the community. The legislation reserving all unlicensed timber was an excellent measure, and I have no doubt that the present agitation to have licenses extended for twenty-one years will be successful. I think every one should encourage the provincial legislature in the attempt to stop speculation, for at the present time, there is as much wild-catting in timber, in British Columbia, as there was in mines several years ago, when the whole province was set back by the bad name it got, through unscrupulous men launching wild-cats on the market."

Professor Fernow Explains.

Editor CANADA LUMBERMAN,

Dear Sir,—Will you allow me to call the attention of your readers to the fact that one or two rather ludicrous errors appeared in the report of my address before the Ontario Lumbermen's Association, published in your issue of March 1? I would ask you as a favor to allow me to assure your readers that whatever appeared incongruous in my talk was of clerical origin. There is only one point I should like to correct. I tried to convey the idea that there was at least one large railroad corporation in the States that showed itself highly interested in forestry by the large appropriation it had made the first year to their new forestry department. Their appropriation was \$300,000, not \$3,000, as reported.

It may also be of interest in this connection to note that at the Montreal meeting of the Canadian Forestry Association there were at least three professional foresters present who are employes of large Canadian lumber and paper companies, and that I am charged to find a competent man for another large paper pulp concern, showing that the practical value of technically educated foresters is beginning to be appreciated in Canada.

Yours very truly,

B. E. FERNOW.

Canadian Forestry Association

Of much more than the usual interest and with a record attendance of lumbermen, trained foresters, statesmen and dignitaries of the church, the annual convention of the Canadian Forestry Association was held in Montreal on March 13th, 14th and 15th last. The conservation of Canadian forest wealth and the urgent need of public attention toward this, one of the most urgent problems of the day, was the dominant topic of discussion during the three days of the convention. Not the least of the striking features of the gathering was the presence of a number of leaders of the Roman Catholic church. Several bishops and dignitaries, not only manifested keen interest in the work of the convention, but took an active part in the discussion. The introduction of the bi-lingual system into the work of the Association was also a pleasing innovation.

Following the formal opening of the convention by Sir Louis Jette, lieutenant-governor of Quebec, came the address of the president, Mr. H. M. Price.

PRESIDENT'S ADDRESS.

Mr. Price referred to the fact that twenty-six years ago the first annual meeting of the Association was held in Montreal. He said that it was most encouraging to see Earl Grey and Sir Wilfrid Laurier leading forestry progress in this country and taking such a deep interest in everything pertaining to the subject. It appeared to him that there was much to be done in this country, as regards the people getting fuller information of the true resources in the way of timber and wood generally. There is great want of more thorough exploration of the timber of the North, not only in Quebec but in Ontario as well, while the resources of Manitoba, Alberta and Saskatchewan are little known. Mr. Price's attention had been called to the large shipments of spruce trees from the Province of Quebec to the United States, for Christmas trees. They run from three to eight feet high, and sell from ten to twenty-five cents each in Canada. This trade should be prohibited, as it has assumed large proportions. Mr. Price stated that Canada had immense areas and, in proportion, a smaller number of men to protect the same against fire, compared with the United States. Referring to the question of wood pulp exportation, Mr. Price said that the matter had been brought prominently to the front by President Roosevelt's proposal to take the duty off wood pulp in return for free pulp wood from Canada. He believed this proposal might justly be made more favorable to Canada by lowering the duties on paper, as the freight on wood pulp is a serious factor in its shipment. Mr. Price was of the opinion that an arrangement in this direction would be more desirable than an export on pulp. He believed in the policy of reciprocity rather than one of reprisal. In connection with an export duty. Mr. Price stated that statistics indicated that the supply of pulp wood in the United States would be exhausted entirely within twenty-five years, at the present rate of cutting.

The directors of the Association had decided that it was not expedient to pass any resolution on this subject, as it might have a political complexion. Moreover, it was one on which strong differences of opinion exist. After referring to the growth of the Association, which now numbers 1,200, Mr. Price concluded his remarks as follows:—

"As regards some definite national policy to be advocated by this Association, I think that outlined by Sir Wilfrid Laurier in his address at the Ottawa convention in January, two years since, is the most definite and practical. It was that all the hills, mountains and plateaus which, are the sources of flowing streams and rivers should never be allowed, for any consideration whatever, to remain anything else than forest. That these portions of the earth's surface should form part of the national domain and belong to the State, which includes federal and provincial governments. That where such portions of these watersheds have been alienated and transferred to private ownership the policy should be to re-purchase them for the national domain."

MR. FISHER'S IMPORTANT ANNOUNCEMENT.

Hon. Sydney Fisher, minister of agriculture, made an excellent speech, in the course of which he aroused hearty cheers by announcing that the Government had decided to greatly extend its forest reserves in the West.

"In appearing here to-day," said Hon. Mr. Fisher, "I speak for the Government in saying that it is most earnestly enthusiastic in its desire to preserve the forest wealth of those lands over which we have control. In pursuance of this we have during the past few years added vast sections to our forest reserves in British Columbia, as has been advocated by your Association. I am now able to say to you that it is the decision of the Government in the near future, that the whole eastern slope of the Rocky Mountains, stretching from the boundary line northwards almost indefinitely, shall be set aside as an inalienable forest reserve. (Loud cheers.) That, however, does not mean that the trees and produce of this immense region shall not be utilized by this and succeeding generations. To properly conserve that it is necessary that the wood crop should be gathered year after year, time after time and utilized in the best manner for the benefit of the people of this country. The people of the West will not be deprived of the products of this region, but the lumber will be from time to time cut for their use, under proper forestry regulations, in such a way as to conserve its resources for all time, yet so as still to supply the immediate necessities of the settlers on those western prairies where lumber is so hard to get." (Applause.)

THE PULP WOOD EXPORT DUTY.

A statement by Mr. Fisher to the effect that in his opinion there should be no restriction placed upon the exportation of either pulp wood or pulp, drew some criticism from subsequent speakers. Mr. Ellis, a well known forestry expert, in the course of his address said, "That is an entirely mistaken idea and I am glad to see that since then not a single speaker has agreed with the remarks of the Minister of Agriculture, in that connection." This statement was greeted with loud applause. In support of his contention, Mr. Ellis quoted the action taken by the Ontario Government some years ago to prohibit the export of saw logs, which had resulted in a great increase in the saw milling industry in Ontario, and a corresponding decrease in the Michigan and Wisconsin lumber mills, which had previously fattened on the products of Ontario forests.

On the final day of the convention the gist of the various addresses was embodied in the following resolution, which carried unanimously:—

"Resolved, that in view of the large losses of timber from fire along the line of the Transcontinental Railway already reported, this Association desires to again impress upon the federal and provincial governments the urgency of fire patrol and other protective measures, as outlined in the memorial passed at the annual convention of the Association in 1907."

"That whereas it has become apparent that in parts of Ontario and Quebec, the bush has been cleared away to such an extent as to seriously and adversely affect agricultural conditions, and it is becoming more and more evident that the industrial land owner cannot be depended upon to restore the proportion between wooded and cleared land so necessary for our agricultural interests: Resolved, that this Association urges upon the Legislatures of Ontario and Quebec the advisability of re-acquiring from the private owners either for the province or for the various municipalities, areas of broken or waste land to form forest reserves, and to provide measures for their management, with the added object of furnishing local supplies for timber and fuel purposes."

The election of officers resulted as follows:—Patron, Earl Grey; Hon. President, Sir Wilfrid Laurier; President, W. B. Snowball; Vice-President, Thomas Southworth, Deputy Minister of Crown Lands for Ontario; Secretary, A. H. D. Ross, Toronto University; Assistants, F. W. H. Jacobs and Miss M. Robinson. The old board of directors was re-elected with the single exception of R. H. Campbell, ex-secretary, who succeeds Mr. Southworth, the newly appointed vice-president.

As spring approaches, the fact becomes more and more firmly established that the much-heralded stock shortage condition is going to hold sway for some little time.

Log and Piling Rafts.

The idea of taking round timber on the Atlantic seaboard was introduced by the late Hugh R. Robinson, C.E., of St. John, N.B., who took out a patent in January, 1886, for a sea going raft.

During the summer season of 1887, Mr. Robinson constructed a raft about six hundred feet long, fifty feet wide and thirty-five feet deep, oval in shape. It was tapered at each end, to about twenty-five feet wide, by fifteen feet deep, very much resembling a huge cigar. It was built on shore in a cradle. When completed the raft was bound around with large and small chains, placed alternately seven feet apart.

Mr. Robinson attempted to launch this raft in the autumn, but it stuck on the ways. They found, after several vain attempts to raise and launch it, that it would have to be taken apart and reconstructed. This was done in 1888, and it was successfully launched and started to New York in tow of the tramp steamer "Miranda." When off Block Island, in a storm, the towing bits of the steamer, which were temporary, gave way and the raft and steamer parted company. Ship captains for a long time after reported passing large quantities of drift logs, but no one reported any damage from contact with them. At from two to three miles distance it is difficult to distinguish between drift logs and drift rubbish, such as seaweeds of all kinds, so that there is no authentic evidence that the raft broke up.

In 1889 Mr. Robinson again constructed a raft of about the same dimensions as the first one, and successfully launched it and sent it to

square and ten feet long in these. In the larger rafts these timbers were forty feet between posts, in the body of the raft, commencing sixty feet from the end. The frame work was tapered to twenty-five feet between posts at the end.

"These rafts were built in four layers, eight tiers of piling in each layer, and each layer was a complete raft in itself. The raft was safe to move any reasonable distance after the first layer was finished. These layers were held in place by hard wood stanchions, fifteen feet apart, these being fastened with cross wires on top of each layer. They were further fastened by taking wires around a twenty-foot section of the centre of the raft and bringing the ends up through each layer as it was built. Before the last layer was completed heavy screw bolts were attached to the wires. These bolts were put through cross timbers, which extended the width of the raft. By screwing the nuts down on these bolts the wires held the bottom and top of the raft solidly together. The layers were further bound into a solid and complete raft by having wires put around and screw-bolts attached to the ends, and these passed through the ends of the cross timbers. Over three miles of one and one-eighth inch diameter steel hoisting cable were used to build and bind each large raft.

"The towing chain of these rafts was put on top of the third layer. About two fathoms projected through a fair leader, built in the front end. To this the tug boat attached her hawser. The chain then led to the hind end, passed around the three layers and was attached to itself again, so that all the towing strain came on the hind end of the raft.

New York, in tow of two ocean tugs, one the "Underwriter." They delivered it in New York in twelve days. These two rafts were built at what is called the "Finger Board," which is on the south shore of Cumberland Bay, near the Joggin Mines, Cumberland County, N.S.

This mode of shipping logs and piling did not seem to be profitable, as the inventor and backers did not make another attempt on this coast. Mr. Robinson went to the Pacific coast and was quite successful in taking large rafts from Oregon to California.

In 1903, Mr. J. G. Elderkin, of the firm of H. Elderkin & Company, of Port Greville, N.S., took patents on an improvement in sea-going rafts. Owing to tonnage being very plentiful and freights low, he did not put them to a practical test until last season, when the above firm shipped five rafts to the United States, three to Boston and two to New York. There were twenty-five thousand pieces in all, about one million lineal feet, or four million superficial feet. Shipping by rafts proved cheaper than by vessel by about twenty-five per cent. Elderkin & Company thus describe their method:—

"Started the first raft in tow of the tug "Underwriter" for New York, on June 3rd, 1907. They experienced very rough weather, having gales and long ocean rolls (a raft's worst enemy). We had the tug intercepted and the raft taken to Boston. The second raft went to Boston; the next two, our largest, were sent to New York, and the last, or fifth raft, to Boston.

"To build these rafts we made a shape, or frame, by taking long timbers and mortising holes near the end, fitting posts six by six inches

"We built these rafts where they floated each tide. This saved the expense and risk of launching. The timber was floated to position in bundles for loading on the raft. The loading went on when afloat and aground. At an extreme high run of tides, there is a difference of over fifty feet between high and low water. The largest rafts were three hundred and fifty feet long, forty feet wide and twenty feet deep. We shipped nothing but round timber in the rafts, but it would be practicable to make the bottom of a raft of piling and the top of it of sawn lumber.

"It was almost impossible to obtain tonnage last season, and if we had not built rafts we would have had that timber left over. We shipped fifty thousand pieces of timber last year on vessels and rafts. The American market was fully stocked with round timber at the close of shipping, and the prospects for a demand for timber were poor. We curtailed our operations and buying to three thousand pieces for shipment this season, and these we may cut into boards and scantling."

Mr. D. C. Cameron, of the Rat Portage Lumber Company, has pointed out the very serious competition that mill men in the Interior of British Columbia will be subjected to within the next few years by the opening up of the large spruce belt, which stretches north of the Prairie Provinces from Lake Winnipeg to the eastern boundary of British Columbia. This vast tract has already been practically opened up by the construction of the Canadian Northern Railway, and will be further developed by the Grand Trunk Pacific.

Market Correspondence

Hesitancy Characterizes Ottawa Buying.

Ottawa, March 25, 1908.—There has been a quiet spell in the lumber trade. A large quantity of the coming season's cut is yet to be sold, but manufacturers refuse to make the reduction on last year's price that middlemen and purchasing agents expect. The latter argue that the decline in wages for shanty men and dullness of the outside market should make the producer come down a little. The manufacturers think, however, that the price paid for a large quantity of deals already sold is evidence that there need be no weakening on their part.

J. R. Booth, who sold all his 1908 deal to Cox & Burstall, has not yet made any contract for the disposal of the rest of his output for the coming summer. Regarding the prices for deals, Mr. Booth says that the reduction on some grades is about counteracted by the advances on other sorts. His mill will produce as much lumber next year as last, if the supply of labor is sufficient. Both last year and the year before scarcity of men affected the production, but the present outlook is that there will be plenty of help. The only alarm felt is that the mill crew may be depleted in harvest time. While there has been much cutting of wages in shanties and railway construction, the prospect is that Booth's gang for the coming summer will be hired at the old rates, which will mean that last year's wages will likely prevail in all the Ottawa lumber mills. One of the reasons for this, is that the cost of living has not moderated since last year.

Active preparations are going on with all the lumbermen for the drive. E. B. Eddy Company have despatched gangs to the Demoine and Rouge branches of the Ottawa to handle the large cut of pulp wood. While the cut of pine was reduced, it does not appear there was any falling off in the taking of raw material for the pulp and paper industry. Some of the lumber men are holding back their driving gangs as they do not count on a breaking up of the ice for a considerable time. The logging operations of the Shepard & Morse Company were confined to the Montreal River. Some four or five feet of snow in that vicinity promises to delay the movement of logs as much as last year.

No further steps will be taken toward the construction of the Chaudiere dam by the lumbermen and others who have been looking into this project, until the Dominion Government give a definite assurance that they will carry out the scheme for impounding the water farther up the Ottawa River. A recent conference was held by Messrs. J. R. Booth, W. H. Rowley, H. K. Egan, Hon. E. H. Bronson, Warren Y. Soper, Geo. H. Millen, J. J. Cormully and R. Blackburn to receive the reports of engineers William Kennedy and J. B. McRae, on their inspection of river works at Grand Rapids and Minneapolis. As the contract of the power owners provides that no money shall be spent until the intention of the Government is learned, the engineer's report was not dealt with. The report showed that at Minneapolis the United States Government maintain dams and river works such as are required at the Chaudiere. The Canadian lumbermen are only asking that four dams be built farther up the stream which, being wooden structures, would cost no more than \$160,000. The negotiations among the lumbermen went on for seven years before they came to a settlement and they would regret, if all this labor was lost by lack of co-operation of the Government. It is understood that Hon. William Pugsley, like his predecessor Hon. Chas. Hyman, is favorable to the scheme.

Much litigation is arising out of the dam which Shearer, Brown & Wills, of Montreal, started to erect near their mills, in the Lievre River. The action entered by Geo. Bothwell against the works, on the ground that they would injure his shipping, is being tried in the Hull Superior Court, to-day. Another injunction against the dam is sought by James MacLaren Company, of Buckingham, Que., which lays claim to the bank and bed of the river at that place. The company allege that the proposed piers and booms would hinder the delivery of raw material

to their saw mills and pulp factory and ask that the structure so far built be removed.

Quebec lumbermen have complained to the provincial government that 10,000 acres of the best timber limits in Labelle county are being fraudulently held by bogus settlers. An individual is accused of having 115 persons, supposed to be settlers, take up lots in the township of Boyer, Nominigue district, and then sell them to him for a small consideration. While there should be settlers on the land, it is said, one speculator has the whole area and is carrying on large lumber operations.

The prospects are that the building season in Ottawa will not open with an early rush this spring. The architects report that they have not so many orders as last year at this time and not nearly as many as the year before. This is said to be, because of the unsettled conditions on the money market, and the belief expressed by many that the prices of building material will go down. The prospective builder is thus in most cases holding off until things become somewhat more settled. The small increases in some sorts of lumber are expected to be offset by reductions in other sorts.

An echo of the strike, which occurred in the McLaren mills a year and a half ago, appeared at the last meeting of the Buckingham council, when one of the councillors asked for particulars regarding a bill of \$2,300 for military protection during the labor trouble. The corporations still have the account under consideration.

New Brunswick Trade Quiet Indeed.

St. John, N. B., March 24, 1908:—In all branches of the lumber industry March has thus far proved the quietest month known for many years. Usually at this time of the year all the big saw-mills are sawing or getting ready to begin the season's work. This year there is little activity apparent in any respect. At present writing there is only one mill sawing in St. John, that of A. Cushing & Company, none of the others having made any move as yet. Judging from the manner in which the other manufacturers are setting about the spring overhauling of their mills, they are satisfied to be ready any time before the first of June. In several cases no start has even been made upon repairs.

In shipping lines the season promises to be an exceptionally dull one. Practically nothing is going forward to the United States by schooner. Very little activity is apparent in this regard. In only a few cases have vessels left their winter quarters. There are few schooner cargoes offering and the indications are that freight rates to American ports will be lower than for many years past. The freight rates which were current during the fall were as follows: Long lumber to New York city \$3.50 per thousand, lath to the same port 70 cents per thousand and shingles to Boston 30 cents per thousand. These figures will probably be reduced to \$3.25, 65 cents and 27½ cents.

As indicated in this correspondence some weeks ago, a reduction in the wages of the mill-hands will probably go into effect at the mills when sawing is begun. At the Cushing mill, the men are working at the same rate as before they asked and were granted an advance of 10 per cent., which happened early in 1907. Stetson Cutler & Company, had been running one of their mills until a few weeks ago, also at the lower rate. It was rumored that the men would go out at both the latter mill and at Cushings, but Messrs. Stetson Cutler & Company found it necessary to close their mill down for a few weeks for repairs. The men at Cushing's mill are working at the reduced rate and it is probable that all the local manufacturers will follow Messrs. Cushings' lead in this respect.

Local lumbering people are already making forecasts in regard to the prospects for stream-driving on the St. John and its tributaries. The work of hauling logs from the yards to the brows is rapidly nearing completion at all the principal points of operation and in several cases has been completed. The success of the driving depends of course on the volume of the freshet. Should the snow at the headquarters waste gradually during the next two or three weeks the freshet will no doubt be low and the driving hard, but should the frost continue well into April the snow will probably melt quickly and a good head of water will then make favorable driving conditions.

The trade in English deals is of a most unsatisfactory character; but small quantities are going forward and so little is being done in the way of buying and selling that it is hard to gauge the market. Demand is light and such prices as are being offered result in practically no transactions. The ideas of dealers and manufacturers in regard to the prices that are obtainable result in a remarkable quiet in trade circles. Local people seem to prefer to wait, and buyers do not seem anxious to increase their bids. The result is a state of inactivity which apparently will end only with higher prices.

Obituary.

Another of the pioneers of the lumbering industry of the Ottawa Valley passed away at Ottawa, on March 22nd last, in the person of Mr. Andrew McCormack. Sixty out of the eighty years of Mr. McCormack's long life had been spent in the lumber industry, latterly in the capacity of lumber broker.

The late Mr. McCormack was born in Troon, Ayrshire, Scotland, on March 19th, 1829. After attending Lockhard College, Troon, for a time, he left for Canada at the age of 16 years, and took up his residence in Bytown. After completing his education here he entered the lumbering business on the Ottawa River. In 1843 he became general manager for the late Joseph Annand, at a point about 200 miles north

THE LATE ANDREW MCCORMACK, OTTAWA.

of the Ottawa, on one of its tributaries. After being 13 years in the position, he joined the firm of McConnell Company, Mattawa, being general manager and junior partner. Subsequently, for a period of two years, he was manager for D. T. Brown, and in 1870 went into business for himself, his limits being on the Upper Ottawa and on the Gatineau. The deceased knew all the limits in the district most intimately. He had grown up with them, and took a deep interest in their development. Some limits he sold as many as six times, one remarkable instance in this connection being worthy of note. A limit which he sold for the first time at \$2,500, brought on the fifth sale made by him \$301,000.

Mr. McCormack had been very successful in business, and amassed considerable wealth. In all his dealings he was a man of the strictest integrity and truth, and had the respect of all with whom he came in contact.

With the death of Levi W. Pond of Edmundston, N.B., which occurred recently, there has passed one of the historical figures of the St. John River lumbering industry. Deceased was widely known and admired by lumberman throughout the province.

Mr. Pond was an expert in the transportation of logs in the stream and for many years, during freshet time in the spring, had entire control of the stream driving of all the logs which came down the St. John

River, while these were passing through that portion of the country, which extends from Grand Falls upward for an hundred miles or more.

He was the inventor of the Pond Sheer Boom. This is a contrivance so arranged that the influence of the current in the river will hold it in such position that the logs, coming down river with the tide, will, having struck it, sheer off in the desired direction. The chief use of this boom is to sheer the logs off points and bars, thus saving time, labor and expense. The sheer booms at Fredericton were installed by Mr. Pond, as well as those from that city all along the river to a point far above Grand Falls.

Mr. Pond received his early experience in the transportation of logs on the Mississippi River. He came to this country in the early sixties. The reforms and innovations which he introduced in connection with the driving of logs down the St. John have proved of great benefit to the lumber industry, both at St. John and along the river.

The late Mr. Pond took a conspicuous part in the trouble which arose out of the desire of two prominent lumber manufacturing concerns at Van Buren, to boom the river in order to hold the main drive, while they separated their own logs. Mr. Pond, whose duty it was to see that the drives were forwarded with all possible despatch, resented the interference and loss of time, and when the authorities failed to aid him, with characteristic grit and determination, he took the law into his own hands. For a few days it seemed as if the matter would develop into a guerilla warfare and the population of the upper river sections was thoroughly wrought up. The climax came when, one day Mr. Pond came down river with a half-score of trusted volunteers, to cut a boom, which had been swung across the river just about Van Buren. The owners of the boom were in readiness and, when an attempt was made, bade Mr. Pond desist, threatening his life and backing up their threats with rifles. Mr. Pond on this occasion retreated, only to return a little later and, defying his opposers, dynamited the boom in the face of threats and the show of firearms. From that day forward Mr. Pond's supremacy was unquestioned. His determination and courage in the face of these difficulties went far toward overcoming a condition which seriously threatened the prosperity of the lumber manufacturing industry all along the river.

Expansion of Trade.

To expand trade in any quarter requires a proper and intelligent understanding of conditions as they exist at the present time, an appreciation of present demand, and foresight to know with a fair degree of accuracy what the future can be counted upon to offer. Manufacturers the world over, whose business has largely increased and expanded, have been able to realize the present demands and size up the future. An instance of such knowledge may be seen in the recent incorporation of the E. R. Burns Saw Company, Limited, Toronto. This company took over the old established business of the E. R. Burns Saw Company, and have since installed a new and up-to-date system in both factory and offices. They have also added to their already complete plant, and are to-day enjoying a largely increased trade under the new management. Mr. Wm. Rankin, who has long been connected with the business, is president of the new company, while Mr. J. B. Hallworth has assumed command as managing director, and with his experience as a manufacturer and business man it is expected that "E. R. Burns' Saw" will become better known, and consequently more largely used. The company manufacture all kinds and sizes of circular, cross-cut, band, gang, and other mill saws, as well as the famous E. R. Burns patent cross-cut saw handle, for which they have a very large trade. In the manufacture of their saws they use only the finest grade selected silver steel, and with their own special process of tempering, and all their work done by men who are experts, their customers run no risk of trouble such as sometimes happens. Every saw is thoroughly tested before leaving the factory, and carries with it the company's absolute guarantee.

It might also be mentioned that they have a special repair department, where their customers can have expert work done, such as hammering, re-toothing, re-tempering, etc., at a moderate cost. This work is also done entirely by experts, and mill owners can rely on prompt and satisfactory service.

Merritt & Company's Cooperage Plant, Stratford.

The cooperage industry is flourishing in Ontario and prospects point to a strong demand during 1908. The financial stringency has apparently not affected this branch of the lumbering industry to any appreciable extent, and prospects point to a greatly increased consumption of staves and hoops this season.

while the four make a total of 4,462 feet. These were teamed in on December 4th last.

Messrs. Merritt & Company have been running their mill all winter with the exception of Christmas week and a week in February, when the mercury sank to 20 below. The firm have now about 500,000 green staves under cover ready for spring trade and are shipping hoops almost daily.

FIG. 1.—GENERAL VIEW OF MILL, YARD AND STOCK SHEDS.

Merritt & Company of Stratford, photographs of whose plant appear on this page, advise us that, owing to the immense quantities of snow which have interfered seriously with traffic in Perth county, they have thus far been able to lay in only a limited supply of logs. Should this condition of affairs continue, however, they intend to do their haul-

During the current year they expect to turn out about 5,000,000 hoops and staves.

Scientists are deeply interested in what is believed to be a means of manufacturing paper from ground wood, in which the waste of mills

FIG. 2.—END VIEW OF MILL.
DRAWN BY
J. L. MERRITT

ing on trucks in the spring. This method is a little more expensive, but it has been found that green logs make better stock.

Fig. 1 gives a general view of the mill and yard, showing some 300 feet of stock sheds. Fig. 2 is an end view of the mill with Mr. H. L. Merritt and some of the mill hands in the foreground. Fig. 3 is a view of four 11-foot logs cut from one tree, the butt log measuring 1,213 feet,

can be used. If successful the plan will eliminate the cost of wood specially cut for the manufacture of paper pulp. The pitch and resin which have heretofore interfered with the use of wood of this character are overcome in the new process by so treating the pulp that these substances pass off in vapor and the fibre is recovered by subjecting the mass to a system of pressing.

FIG. 3.—FOUR ELEVEN-FOOT LOGS CUT FROM ONE TREE.

The Growth of the Cooperage Industry.*

By HENRY HERGET.

Cooperage is the art or business of making casks, barrels and other rounded vessels, the sides of which are separate staves, held together by hoops, usually iron.

There are three classifications of cooperage: that known as dry or slack-barrel cooperage, made to contain such commodities as sugar, starch, etc.; white cooperage, referring to tubs, pails, etc.; and wet or tight cooperage, as containers for liquids. It is this latter class of cooperage in which this Association is particularly interested. Tight cooperage is classified as provision, oil and whiskey cooperage, the latter being subdivided into alcohol, spirt and whiskey—that is, bourbon and rye cooperage.

White oak is generally used in the manufacture of this class of cooperage, particularly in the package demanded by the distillers, for which the very best quality of white oak is required for both staves and heading. The development of the cooperage industry brought with it, as a result, a great improvement in the manner of preparing the stave for the barrel. As conditions improved more demands were being made on the holding qualities of the barrel, until to-day we have, as a rule, probably the best packages that have ever been made.

The cooperage industry has grown to marvelous proportions, especially within the last twenty-five years, when the larger plants throughout the country began making barrels by machinery, and this has been improved to such an extent that every large shop in this country is operating by machinery. There are still quite a few hand shops in this country, but tight cooperage is principally made in shops run by machinery, and the entire barrel is thus made, the process being somewhat as follow:—

BARREL MANUFACTURE.

The stave, being first kiln-dried, is brought to the jointer wheel, where it is joined according to the width of the stave and the bilge required. Then the barrel is set up in a form, usually about 20 staves to the barrel, and one end drawn tightly with a windlass. The package is then sent through the steambox for the purpose of making the staves more pliable, so that the other ends of the staves can be drawn tightly from the inside so as to get it warm enough to heat the staves entirely together without breaking them.

DRYING THE PACKAGE.

The package is then heated with shavings, coke or gas, until the staves have become thoroughly dry, the idea being to heat the package through. After being taken from the fires, defective staves, if there are any, are taken out, and then the truss hoops are driven on by hand. The package is then sent to the trusser, where the truss hoops are drawn as tightly as can be, so as to hold the staves together while going through the crozing machine, where the chime is made, and the staves are crozed to receive the heading. The package then is flagged at one end to make it absolutely tight, the same workman fitting in the head.

HEADS AND HOOPS.

It is then sent to the heading-up machine, where the head hoop is placed; thence to a man who puts in flag at the other end of the barrel, and again the process of putting in a head and head-hoop is repeated. The barrel is then sent to the lathe, where one-half is planed. One of the truss hoops, which has held the barrel up to this point, is then taken off; and the three or four necessary hoops for half the barrel are supplied and driven tightly by a hoop-driving machine. Thence it is taken to another lathe, and the remaining hoops for the barrel are furnished and driven, after which the barrel is put on a revolving stand, and with sharp instruments boys remove what flagging protrudes from the staves so as to give the package a finished appearance.

After this the package is subjected to a severe steam test and, in the case of spirit barrels, the tannic acid is removed in order not to impart any taste to the contents of the package, and so that the spirits in the package may remain absolutely white and clear as pure spring water. After several days of drying the package is ready to be filled, it being unwise to fill the package immediately after being made, because of the dampness of the staves reducing the proof of the spirits. On account of the high degree of proof, 190 degrees, and because the contents must re-

main colorless and not be tainted by the taste of the wood, this package is probably the hardest to make of any in the tight barrel cooperage list, as it is not allowed to be prepared or sized in any way. The alcohol package is thoroughly glued, and therefore the requirements are not so particular.

BOURBON BARRELS.

In the making of a bourbon barrel the process is similar, excepting the charring of the package and the finishing. By this, I mean that the tannic acid is left in the barrel to color the spirits, while the charcoal is for the purpose of absorbing the ether, fusel oil and other impurities. I might add here, for the information of the stave manufacturers, that 190-proof spirits will find seed-holes in less time than any steam or air test ever known. These little innocent holes are the worst thing the cooper has to contend with.

The development of the cooperage business carries with it improvement in the manufacture of staves, the quality of the package being entirely dependent on the quality of the staves. In this connection I would say there is no stave made that is too good for a spirit package.

WINE SHOOKS.

There is another branch of the cooperage business known as wine shooks, where the stave is prepared, but not set up in barrel form, and is bundled, usually for export to South America.

THE MEASURE OF CAPACITY.

A barrel is sometimes used or spoken of as a measure of capacity: thus, in England a wine barrel is 31 1-2 gallons; the London ale barrel, 32 gallons; the country ale and beer barrel, 34 gallons; while the London beer barrel is 36 gallons, etc. In this country a whiskey barrel is supposed to contain 46 to 48 gallons; oil barrels, 50 to 55 gallons; while the Chicago Board of Trade prescribes exactly as to what shall constitute a lard barrel to be regular for delivery under the rules.

In the spirit distilleries in Illinois are some very large casks, of from 40,000 to 60,000 gallons capacity. There are also very large wine casks in California which, as in Europe, are used for the storing and ageing of wine. Probably the most famous cask in the world is the one in the Schloss, at Heidelberg. It was the writer's privilege to stand on it on his visit there in 1895.

THE COOPER'S DANCE.

There is a very pretty custom in connection with the cooperage business, known as the cooper's dance. This is a curious ceremony performed by the coopers of Munich, in Bavaria, every seven years, during the last day of the carnival, on Shrove Tuesday. According to tradition, the custom originated in 1517, when Munich was ravaged by a terrible plague. Desolation and despair reigned; fear took possession of the citizens, so that even when the plague began to abate they durst not open their doors or windows or leave their houses, fearing the air and water were tainted with disease. Finally the master coopers decided to restore confidence to their fellow citizens by public shows and amusements; so one day the whole town was surprised by a procession of coopers dressed in bright red jackets, waving fresh green garlands in time with the music, while they called to the people to open their doors and windows and come in the open air.

TRADE SAYINGS.

There is an expression which might well be made use of at this time, owing to the peculiar trade conditions, and that is "Stave it off," meaning to fight it out with staves—to fight until a decisive result is obtained. I hope the Stave Association will be firm in the stand taken in maintaining prices, and will not let a temporary depression in business bring on ruinously low prices.

Japanese Make Pulp from Grass.

The Agricultural College, Tokio, recently announced that it had discovered a method of making pulp from bamboo grass, sasa, for which the highest results are claimed. The bamboo grass is very common in Japan and has been put to little use. It is proposed to teach the method to the Japanese farmers, and as it is hoped that pulp will be produced cheaply by it, both the farmer and the consumer should benefit. The matter is still under investigation and no details are obtainable.—Scientific American.

* Paper Read at the Memphis Meeting of the Tight Stave Association.

"Northern Express" Has Rivals.

In reference to the article in our issue of March 1st, describing the logging engine of the Sturgeon Lake Lumber Company of Prince Albert, Sask., we have received the following communication from Mr. J. C. Fair, of Black Cape, Que.:—

Editor CANADA LUMBERMAN

Dear Sir,—I wish to call your attention to a statement in your issue of March 1st, which is not in accordance with the facts. The article in question read: "The Northern Express is the only railroad engine of its kind in Canada," and had reference to a log and lumber hauler operating for the Sturgeon Lake Lumber Company, north of Prince Albert, Sask. As a matter of fact there are at present three other similar engines operating in Eastern Canada this present winter, the John Fenderson Company at Sayabec, the Tracadie Lumber Company at Caplan, and Mr. Chouinard, a logging operator in the rear of St. Jean Port Joli Station, all in the Province of Quebec, and these machines are of a very much more advanced type than the one at Sturgeon Lake. In addition the Alex. Dunbar & Sons Company, Limited, of Woodstock, N.B., are building a still more improved and powerful machine, which will haul anything from a train load of logs to a brick house. They have spent much time and money studying the weak points of the machines at present operating, and have perfected a machine which will revolutionize log hauling. One of the improvements deals with hill

LOGGING ENGINE AT WORK.

climbing, so that the machine can be used in very rough country. Two of these engines are at present on exhibition at their factory at Woodstock. I enclose a photo of the Tracadie Lumber Company's engine at work.

Yours very truly,

J. C. FAIR.

Removing Tree Stumps.

It is not so many years since stumps left after a forest had been removed were regarded as a great nuisance. Timber has now become so valuable that the "stumpage" instead of being a nuisance, is a source of revenue. This, however, is true only when there is a large quantity to be disposed of. To get rid of a few stumps is an expensive and troublesome business, and therefore an old and useless recipe, which is found in many books, has singular attractions for some. We are directed to bore a hole an inch and a half in diameter and eighteen inches deep, in fall or winter, put in about two ounces of saltpetre, fill the hole with water, plug it up tight and wait till spring, when it is said, that if we turn a pint of kerosene on it the stump will slowly smolder until it is all consumed. The thing looks plausible, but it will not work. The best way to remove a few stumps is to bore holes in them, insert a little dynamite, and blow them to pieces. They can then be easily removed. But do not handle dynamite until you have been taught by an expert,

The Expansion of the Lumber Industry in the Crow's Nest Pass, B. C.

By A. E. WATTS, Wattsburg, B. C.

Eleven years since not a saw mill was in operation between the Prairies and Kootenay Lake. Six years ago the production of lumber in the interior of B. C. was under 25 million per annum. The year before last we shipped 250 million, an increase of ten-fold in five years, and the greater part of that expansion took place during the last three years. Also note that there was but one trans-continental railway, with its branches undeveloped, while in the near future we shall have three railroads across the continent, making it reasonable to expect that the demand for lumber and other products will increase in greater ratio in the immediate future than during the past five years, I predict that it will. The lumbermen of B. C. possess an asset that will be worth more than the capital of all the banks in Canada. It is the last great virgin forest on the continent, and within a few years the United States will open her doors free to Canadian lumber and when she does the timber of B. C. will at once leap to double its value on the stump.

It is an interesting fact that, notwithstanding the enormous increase in the population of the United States, and the increasing use of iron, steel, stone, cement and bricks in the place of wood during the last few years the consumption of lumber per capita has increased 10 per cent. Many of the States are already completely denuded of timber. Very shortly they simply must take Canadian lumber, therefore, it is the height of folly for mill men to tumble head and heels over each other in the attempt to give their valuable and costly stocks away at cost or less. If the market is temporarily gorged, limit production; hold your stock, even if your banker does tell you to cut your \$10 logs into ties that produce \$7.50 per M., because the bank must have cash to pay for the palatial offices and residence, built for the accommodation of his majesty the manager. In that way are legitimate industries strangled in their birth.

Ten years since all along the Crow's Nest line was virgin forest. To-day all the most accessible timber is cut off; all timber suitable for good ties within reasonable reach has gone, and no attempt has been made at reforestation. In a few years Canada will have twenty thousand miles of railway, and ties need replacing every six or seven years. If they use spruce as the G. T. P. Ry is doing they will need replacing every four years so that now is the time to plant trees to meet the enormous demand of the future.

Some of the American Railway Companies have already planted large quantities for that purpose. I have had some correspondence with the president of one road, and he kindly sent me seed with instructions how to cultivate the *Catalpa Speciosa*, a tree that will make a growth in five years, large enough for ties. I shall be pleased to furnish information to persons who may be interested in this subject. The government should encourage reforestation and might offer a small bonus to any person planting trees. In the case where license holders have cut over their limits, they might be allowed to hold the land in perpetuity, on the conditions that trees were planted in proportion to those cut off. This would assure a permanent income to the government from crown dues, and preserve the forest wealth, a matter of vital importance to the whole country in many ways. The decay of ancient mighty nations can be traced to their neglect in that respect—rich and productive countries made arid, barren deserts.

The Swedish system of preserving forests is worth adopting. They have timber lands that have been cut over and over again for hundreds of years and are just as productive to-day as ever they were.

History Repeated.

The agitation now going on in Canada for forest preservation was experienced in a somewhat different form three centuries ago in England. At that time the rapid consumption of wood for iron smelting purposes alarmed the politicians. As early as the reign of Elizabeth there were loud complaints that whole forests were cut down to feed the furnaces, and Parliament interfered to prohibit the manufacturer from burning timber. Smelting consequently languished, and by the accession of James II. the bulk of the iron used in the country was imported from abroad.

THE WOODWORKER

Encourage People to Build.

The time has arrived when people who have been holding back in their building projects in anticipation of an easing up in the demand for labor and materials, may well decide to proceed with their operations. From the present prospect the coming season will be an unusually good one in which to start new enterprises. Those who are engaged in the business of building can do much to stimulate the industry by recommending all prospective clients to go ahead, for a better opportunity will not be offered for a long time to come. Heretofore there has been such a rush of work that owners have feared their projects could not have close and careful supervision; materials have been difficult of prompt delivery, and labor of the higher classes has been hard to obtain. No doubt these facts have caused many men, who have had the available funds, to refrain from starting new buildings. There has also been fear of strikes, in the case of buildings under way. All of these obstacles are now less troublesome, and the wise man will take advantage of his opportunities and proceed with business. Now is the time to build.

More Building Means Cheaper Money.

Throughout the entire country there was no reason for self congratulation regarding the returns for new buildings in January. Nevertheless the exhibit is not so bad as it might appear and at the present moment there is much more work coming into view than is indicated by the current run of building permits. Many investors who shrank from putting money into real estate improvements by reason of the high prices of labor and materials prior to the recent period of depression are now investigating the situation with a view to presently embarking on their undertakings. A constantly increasing amount of estimating and figuring is being done and from all accounts a very considerable amount of work is going to be in hand with the coming of spring. Particularly in the West is the opening up of building activity noticeable. In Calgary at the present time there is work under construction to the value of over \$900,000. Prince Albert and Vancouver are almost equally notable examples, and all over the Dominion there is an awakening interest in structural undertakings that bodes well for the future.

Money must become cheaper, however, and until it can be had for real estate investments at 6 per cent. and under, there is reason to expect that speculative building will be detrimentally affected. That rate will be reached before many months, in all likelihood, and perhaps even sooner than is generally expected.

Framing for Sliding Doors.

By W. C. A. STEVENSON.

Sliding doors and hangers are often condemned when they do not work perfectly, when the real fault lies in the manner in which they have been put up. Great care must be taken to avoid all settlement in the floors below, and the work throughout must be made plumb, level, and in line. All the studding and other timber must be of best quality, and perfectly straight, as the trouble is usually caused by the track getting out of level and line, by the floors settling or some of the timbers warping and twisting out of place after the doors have been hung. There are a number of different makes of door hangers, any one of which will give good satisfaction if properly put up according to the manufacturers' directions, which usually come with them.

I am showing herewith a sketch which shows the section view and a portion of the side view of the framing timbers for a sliding door. A slight difference may require to be made for different hangers, but in the main this is the proper method. Each different piece is indicated on the sketch, so that it will be easily understood.

Note how the track box is formed, by a 7-8 inch board, TB nailed

on each side, and the 2-inch by 4-inch spreader, S, on top (these are to extend as far as the doors slide back, to prevent any dirt, such as plaster, etc., from working into the track and hangers). The 2-inch by 4-inch, S, also forms a tie member for the truss over the opening, the studding being well spiked into it from both sides. The inside of the studding should be boarded on the inside down to the floor, back as far as the doors slide, with cheap 1-2 inch boards, to also prevent any dirt, etc., from working under the doors.

In putting up this work the side to which the track is to be screwed is put up first, the header H, being put from the floor, just 1 inch higher than the door, and perfectly level. Then frame the truss as seen, and put up the track board T B, straight and true with the bottom of the header H. The track is then screwed on to it, so that when the hanger is put on, and the plate fastened to the door, it will be just the 1 inch below the header, the 1 inch allowing for the jamb head. The 2-inch by 4-inch S, can now be put up to the side already up, and

the other side built on the floor and raised up bodily, the head jambs being placed as closely together as the hangers will allow. This side jambs are held 2 1-2 inches apart, so that the doors will have plenty of play, stops being set to the doors after they are all hung, to make the finish.

Note the guide iron at the floor. This works into a groove in the door and is furnished with the set of hangers.

Roofs of Various Pitches.

We reproduce from "American Carpenter and Builder" an extremely useful diagram, designed to assist carpenters in building roofs of various pitches. The fractional pitch lines for the common rafters are shown; for each inch in rise up to the full pitch and their lengths are expressed in decimal figures to the one-hundredth part of an inch, while to the right of the blade the same is expressed for the corresponding octagon and for the common hip or valley for a square-cornered building, which are reckoned from 13 and 17 on the tongue respectively. However, neither

is absolutely correct, though near enough as far as the cuts are concerned, the greater deviation being in the hip for the square cornered building. It lacks .0295 of being 17 inches and represents the run of the hip to a 12 inch run of the common rafters. Its true length being 16.97505 inches, this is the length from which we have reckoned for the lengths of the hips instead of 17, as is the usual custom. This may seem a trifling difference, and so it is in a short run and low pitches; but suppose it is for iron construction. To begin with, the shortage of each foot in run with the common rafter is .0295 of an inch; added to this the gain

well to know this discrepancy and guard against it when the occasion demands, and for that reason we give the correct amounts. The shortage in the octagon is not so pronounced. Instead of it being in the run, it is the tangent that is lacking the same amount, it being 4.9705 instead of 5 inches. This, coming as it does, cannot affect the length of the rafter nearly so much as in the above.

We explain this shortage better by referring to that part of the illustration which shows the plan of a combination square and octagon frame with the heel of the steel square resting at the centre. From this

it would have in the pitch, which would be .015 of an inch by the time .0295 to start with would be a difference of .0445 of an inch to the foot in run with the common rafter. Now suppose the run to be 18 feet; 18 times .0445 equals 8 plus, or 19-24 of an inch difference; or, if no account was made of the gain in pitch, the .0295 of an inch in the run would amount to over half an inch in the length of the hip alone. This is a common error, and while it is not much, and probably would never be noticed in wood construction, it is

it will be seen that the two outer circles catch the corners of the frame and seemingly intersecting the tongue at 13 and 17 and represent the figures to use on that member for the seat cuts, but the true length of the run of the hip is 16.9705, and that for the tangent of the octagon is 4.9705.

In connection with this illustration we also give a table of decimal equivalents to the one-twenty-fourth part of an inch for convenience in finding their value in common fractions.

Hints on Shingling.

A correspondent of the "Woodworkers' Review" writes that journal as follows regarding the rusting of shingle nails:—

"For several years I have carried on a jobbing carpenter business in a town where shingles are mostly used for roofing purposes, and the nails rust off before the shingles are rotten, especially the wire nails.

"Most carpenters here think it is due to the acid in the cedar, but I have made this subject a study for a number of years, and I don't agree with the acid theory. I have noticed that the less pitch the quicker the nails rust off. I repaired two houses about two years ago, that were built at the same time, thirty-four years before. I overhauled the roof of one, and the same shingles were on as when it was built; they were put on with the old iron nail, and both nails and shingles were in sound condition, and I only had to put in about a dozen new shingles. These were split cedar shingles and shaved smooth.

The second house was shingled with a good grade of sawed cedar shingle, and had been reshingled once since the house was built. This second lot are so split and rotten that I had hard work to patch it, as they did not want it all done over again just then. The nails are practically all rusted off, I had to re nail the entire roof.

"Both houses had a square pitch roof, and were within fifty rods of each other. Now my opinion is that it is not the acid in the cedar, but that it is the roughness of the sawed shingles; this holds dampness, as the cedar is very porous, and therefore they are wet on the under side more than half the time.

This damp moisture acts on the wire nail quickest, because it is a finer polished steel than the cut nail. I think that the old iron cut nail stands best.

"Now for another example of my theory: take the walls of a building that have been shingled for years, with a very cheap cedar shingle with lots of sap, some with wire nails are in good condition to-day, so I cling to the damp moisture idea."

The Lathe as a Box Machine.

No one familiar with the box making industry would look for a turning lathe in the average box factory. And if they did look for it there, they wouldn't likely find it. Still the lathe is quite a box machine, and it is more than likely, if the history on the subject were looked up, it would be found that the first machine-made box was made on the turning lathe.

The turning lathe was probably the first woodworking machine invented. Boxes were made before the times of machinery and probably before the time of the lathe, but it is more than doubtful if boxes were made by machinery in any other manner earlier than they were made on the turning lathe. The boxes referred to as being made on the turning lathe are not the rectangular boxes we are given to thinking of, when the subject of boxes is mentioned, but round boxes mostly of small size and sometimes of decorative nature. Probably the first machine-made box receptable was a wooden bowl turned out. But the main product of the lathe in the box line is small boxes for a great variety of purposes. One and probably the original type of large quantity was the pill box, in which both the box and the lid were turned, with the lid fitting neatly on the boxes. There are quite a number of boxes of this type made to-day for various purposes, especially in connection with drug store supplies and for many other articles in the novelty class that are wooden boxes. Some are plain turned, some neatly polished and varnished, and some turned in various designs.

It would be difficult, indeed, to get a complete line on the wide variation or quantity of boxes made on the turning lathe, but, if the data could be gotten up and the array of boxes displayed in pictorial form, it would present not only an interesting feature, but quite an aggregate amount of work that might properly be classed with boxes. Yet it is very seldom given consideration in connection with the subject of boxes and box shooks.—Packages.

At Montreal on March 13 last a new society, known as the Canadian Society of Forest Engineers, was organized with the following officers: President, Dr. B. E. Fernow; vice-president, Mr. R. H. Campbell; secretary-treasurer, Mr. W. H. Jacombe,

C.P.R. Experiencing Tie Shortage.

Scarcity of ties, it is claimed, has acted as a serious deterrent in the completion of the C. P. R. line between Winnipeg and Fort William. In this line, but the work of the past season has experienced the most serious hindrance. Five years ago little or no difficulty was experienced by the company in letting enough contracts so that the winter's output was quite sufficient to meet the demands of the summer work. Then the price ranged from 10 and 12 to 15 cents per tie. Three years, however, have changed this phase of the work, and not only the C. P. R., but all the railway companies which have construction enterprises under operation, are experiencing the same difficulty. The price of ties has increased fully four fold, and it is even with the greatest difficulty that they can now be procured at fifty or sixty cents each. The operations in the woods were hampered last year by excessive depth of snow. This year the early part of the winter was also unfit for logging operations on account of lack of snow. On an average of 15 ties to every thirty feet, which is an approximate average of the ties used in the present construction, this would mean, at least, 2,640 ties to the mile, making the total requirements between Winnipeg and Fort William slightly over 1,100,000 ties for the distance of 420 miles.

Coast Lumbering Industry Healthy.

Hon. R. G. Tatlow, minister of finance and agriculture in the provincial legislature, made some interesting comments on the lumber industry in his budget speech. After remarking on conditions during the last year, he said:—

"I venture to say that the lumbering interests of British Columbia were never more healthy than at this time, and I have every confidence that the steps taken by the Government to check the indiscriminate staking of timber lands will materially aid in maintaining this satisfactory condition. It is hoped that our policy of forest reservation will encourage more demonstrative methods of cutting timber, for it is natural to suppose that the holder of a license will adopt every means to secure the best results, so that the cut made in the twenty-first year may prove as profitable as that of the first. This has been done on the Ottawa River and in other parts of the East and the same wise policy should be exercised here. The British Columbia Timber and Forestry Chamber of Commerce, the Canadian Forestry Association, and all other societies formed in the interest of the lumber industry should combine in a campaign of education, which would teach every man in the business to look upon proper methods of logging as the fundamental principles of success in his calling.

Nova Scotia Lumbermen Meet.

A meeting of the Western Lumbermen's Association was held in Halifax on February 26th last, to consider matters of interest to the industry. The following firms were represented:—

T. R. McGarth, Tusket; Parker, Aikens & Company, Yarmouth; Blackadars & Company, Yarmouth; D. O. Saunders, Lake Annis; Clark Bros., Bear River; D. O. Mills & Sons, Annapolis Royal; J. W. Lowe & Sons, Liverpool; Nathan Vienot, Riversdale; E. Zwicker & Son, New Germany; Anthony Lumber Company, South Maitland; A. E. McMahon, Aylesford; Davidson Lumber Company, Bridgewater; R. Davidson & Sons, Bridgewater; Alfred Dickie Lumber Company, Stewiacke.

The first matter brought before the Association was that of rates on the Halifax and South Western Railway. Provincial Engineer McColl was present, and took part in the discussion. A comparison was made between the rates on that line and those charged on the D. A. R., most of the items mentioned being in favor of the latter road, and the Association is seeking to have the Halifax and South Western rates lowered somewhat to correspond with those on the D. A. R.

An opinion was expressed that a reduction of one-half cent on all lumber rates would be satisfactory to the Association. The D. A. R. charged upon the basis of a five mile haul and the H. & S. W. on a ten mile haul, which made a considerable difference.

President Whitman thought it an important matter and worth the attention of the Association, and that an effort should be made to have

the rates adjusted on the foregoing basis, to have them suitably fixed and submitted to the Government for approval.

On short hauls the rate was not objectionable, but on long hauls there was a difference of about 25 per cent. Where there was a competitive water route, shippers got lower rates than where there was no competition, and that was considered by the railroads to be legitimate business, and was a very difficult matter to adjust to the satisfaction of both the railroads and the shippers of lumber.

A resolution was moved by Mr. Aikens, seconded by Mr. McGrath, that the Government be asked to arrange a schedule of rates on the H. & S. W. road on the five mile basis, instead of the ten mile, now in use, that is, the rate to be charged on 5, 10, 15, 20 and 25 miles instead of 10, 20 and 30. The motion carried unanimously.

Description of Forestry Courses at the University of Toronto.

1. Synoptical Course.—An introduction to the subject of forestry, and a survey of the economic and political aspects of timber land management.

This course, carried on in seminary style, is designed also for students of political economy, and all those who desire a general knowledge of forestry problems. 25 hours.

2. Descriptive Dendrology.—A taxonomic study of the forest trees of North America, laying special stress on the characteristics which lead to the recognition of the species in the field; with practice work in securing familiarity with morphological and other characteristics for identifying Canadian trees and shrubs. 25 hours.

3. Forest Physiography and Forest Description.—The geographical description, botanical composition and character of forests of the world, and of North America in particular, with special reference to the ecological factors, climate and soil, influencing forest growth. Field practice in recognizing forest types and in making forest description. 25 hours.

4. Timber Physics and Wood Technology.—Study of the histology of wood, with a view to identification of the different woods; recognition of their normal and abnormal physical characteristics and faults. Me-

chanical and technical properties of wood and the various technological uses dependent thereon. Lectures and laboratory work. 50 hours.

5. Pathology of Trees and of Wood.—The diseases of trees and decay of structural timber, their recognition, causes and prevention. 25 hours.

6. Biological Dendrology.—Life history, laws of growth of trees, their dependence on ecological factors, and silvicultural requirements of different species. 25 hours.

7. Silviculture.—Principles and practice of the art of forest production and forest improvement, nursery practice, planting, and methods of natural reproduction. 75 hours. Practice work in addition.

8. Forest Mensuration.—Methods of ascertaining volume of felled and standing trees, of whole forest growths, timber estimating, determining accretion of trees and stands. 100 hours, including practice work.

9. Forest Exploitation.—Methods and means employed in the harvest of forest products, logging, transportation, milling, and preparation for market. 50 hours, including excursions to field operations and mills, and special lectures by expert lumbermen.

10. Business Methods in the Lumber Trade.—Description of usages in shipping, receiving and selling forest products; inspection and grading; financial methods. 10 hours.

11. Forest Protection.—Methods of guarding against trespass, loss from fires, insect (applied entomology) and other damage to forest crops. 12 hours.

12. Forest Management and Administration.—Principles and methods underlying the preparation of working plans for continuous wood and revenue production, and principles of administration of forest properties. 75 hours.

13. Forest Valuation and Finance.—Methods of ascertaining money value of forest growths, and application of the principles of finance to forest management. 25 hours.

14. History of Forestry.—Historical development of the economic and technical features of modern forestry at home and abroad. 25 hours.

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" will be inserted in this department at the rate of 15 cents per line each insertion, payable in advance. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order.

FOR SALE—LUMBER, ETC.

WE HAVE FOR SALE A FEW CARS OF cedar posts and shingles, pine lath, clear face and better red pine and a good quantity of white pine and spruce lumber. JOHN HARRISON & SONS Co., Saw and Planing Mills, Owen Sound, Ont. tf

FOR SALE

Spruce 1", 2" or 3".
No. 1 Spruce lath 4' x 1 1/2" x 3/8"
Box 50, Bathurst Village, N.B. 7

FOR SALE

ALL LENGTHS OF CEDAR POLES AND posts. Apply Box 685, Peterboro, Ont. 10

FOR SALE

CEDAR POSTS AND POLES ALL LENGTHS; Cedar Ties and Squares. Write Box 151 Canington. 7

FOR SALE.

CURRENT SEASON'S CUT, CONSISTING of 2 to 3 million feet. Will saw to your order. Write us. PINE LUMBER CO., Pine, Ont., (Near Cartier.) tf

FOR SALE.

CURRENT SEASON'S CUT, ABOUT TWO million feet of Red & White Pine to be sawed to order, also one million and a half Red & White Pine last season's cut, shipping order. Address Box 52, Chapleau, Ont. 9

FOR SALE.

I AM PREPARED TO DELIVER F.O.B. cars here 2,000,000 feet cedar logs cut to order into any size timbers from 4" x 4" to 12" x 12", and from 8 to 20 feet long, any time up to next May; 3,000 telegraph poles. Correspondence solicited. J. B. WINLAW, Winlaw, B. C. tf

FOR SALE

300 M. 4/4 Mill Run Birch.
100 M. 6/4 " " "
200 M. 8/4 " " "
60 M. Log run Basswood.
30 M. ft. 6/4 C. & B. Soft Elm.
Will sell in grade or M.R. Prompt shipment, Bone dry. Inspection guaranteed. Write T. L. BAILLIE, North Bay, Ont. 7

FOR SALE

10 cars Cedar Posts, 8 ft., 4 1/2" and up.
1 car " " " 3 to 4 in.
3 cars N.B. Cedar Shingles Clear Whites.

SAW SHINGLE AND LATH MILLS

1 rebuilt American automatic sawing machine.
1 nearly new American L.H. three block saw mill.
1 refitted R.H. three block sawmill complete.
1 nearly new L.H. three block carriage for No. 1 mill.
1 nearly new gang edger, 3-18" saws.
1 new double edger, 2-16" saws.
2 new upright swing shingle machines, 40" saws.
1 new horizontal shingle machine, 40" saw.
1 nearly new upright swing shingle machine complete.
1 refitted Dauntless shingle machine, 38" saw.
1 nearly new Canada Favorite shingle machine.
1 refitted Smallwood automatic shingle machine.
1 refitted Searly self-acting shingle machine.
1 new shingle jointer with 40" saw.
1 refitted shingle jointer with 42" wheel.
2 new No. 2 lath machines and bolters complete.
1 nearly new No. 1 lath machine and bolter.
1 new wood frame lath machine and bolter.

HOISTING ENGINES AND BOILERS

1 10" x 12" double cylinder single drum hoisting engine with or without boiler.
1 7" x 12" double cylinder, double drum hoisting engine without boiler.
1 7" x 10" double cylinder, double drum hoisting engines with boilers.
1 7" x 8" single cylinder, single drum hoisting engine without boiler.
6 6 1/2" x 8" double cylinder, double drum hoisting engines with boilers.
2 6 1/2" x 8" double cylinder, single drum hoisting engines without boilers.
1 6" x 10" double cylinder, double drum hoisting engine without boiler.
1 5 1/2" x 7" double cylinder double drum hoisting engine with boiler.
1 5" x 7" double cylinder single drum hoisting engine without boiler.
1 5" x 5" double cylinder single drum hoisting engine without boiler.

AUCTION SALE

— OF —

VALUABLE TIMBER LIMITS, SAW MILL,

Plant, Supplies, Mining Lots, Logs, &c.

— OF —

THE EAST TEMPLETON LUMBER COMPANY, LIMITED.

There will be sold by Public Auction, at the Russell House, in the City of Ottawa, on Tuesday, the 15th day of September, A.D. 1908, at 2.30 o'clock p.m., by THE EAST TEMPLETON LUMBER COMPANY, LIMITED, the following Timber Limits, Real Estates, Saw Mill, Mining Lots, Plants, Supplies and Logs in transit, namely:—

Parcel Number 1. "Coulange Limits," comprising 156 square miles of Timber Limits on the Coulange River in the Province of Quebec, covered by Licenses Numbers 149, 150, 151 and 152 of Season 1873-74 and known as Berths W, X, Y and Z, together with certain Limit Plant, Supplies and Live Stock to be sold therewith.

Parcel Number 2. "Hibou Limit (Gatineau)," comprising 20 square miles of Timber Limit on Hibou and Ignace Creeks covered by part of License No. 350 of Season 1873-74, together with certain Limit Plant and Supplies to be sold therewith.

Parcel Number 3. "Wakefield Limit (Gatineau)," comprising 8 square miles of Timber Limit in the Township of Wakefield covered by License No. 38 of Season 1873-74.

Parcel Number 4. Several Freehold Timber Lots in the Township of Wakefield.

Parcel Number 5. "Black and Dumoine Rivers Limit," comprising 26½ square miles of Timber Limit on the Black and Dumoine Rivers covered by part of Licenses Number 362 and 369 of Season 1873-74 together with certain Limit Plant and Supplies therewith.

Parcel Number 6. Real Estate, Saw Mill, Lumber Yard and Wharf at East Templeton. This parcel consists of about 208 acres more or less of Freehold and 8 acres of Leasehold land at East Templeton, P.Q. (about 8 miles below Ottawa on the Ottawa River), together with a fully equipped Saw Mill and Machinery erected thereon having a capacity of 150,000 feet per day, with Lumber yard, Wharf, Railway siding, Cars and other plant and machinery therewith.

Parcel Number 7. Mining Lots. This parcel consists of several mining lots and mining rights in the Townships of Wakefield, Buckingham, Portland East, Portland West and Derry.

Parcel Number 8. A large quantity of logs, timber, telegraph poles and ties now lying in and about the Ottawa, Coulange and Gatineau Rivers at and in transit to the above mentioned Saw Mill.

The first seven parcels above mentioned will first be offered for sale en bloc, subject to a reserved bid fixed by the Vendors. If the reserved bid is not reached, then each parcel will be immediately offered for sale, separately, subject to a reserved bid fixed by the Vendors.

Full particulars and complete descriptions of the respective parcels and the terms and conditions of sale will be made known at the time of sale and may be seen on application to the Vendors at East Templeton, P.Q., or to their Solicitors, Messrs. Gormully, Orde & Powell, No. 33 Sparks Street, Ottawa

Dated this 3rd day of March, 1908.

FOR SALE

LOTS 7, 8 AND 9, TOWNSHIP OF PERRY, about 3 miles west of Emsdale Station, Grand Trunk Ry., containing approximately 400,000 ft. Birch, 150,000 ft. Balsam and Spruce, 200,000 ft. Hemlock, large quantity of Beech and Maple and small amount of Elm and Black Ash; clear title. Good winter road to station, short route. Price, \$3,000. Apply BENJAMIN MABEE, Emsdale, Ont. 8

St. John River Rights.

Because of the alleged action of an American lumber company in taking possession of the St. John River, where it forms the boundary line between Maine and New Brunswick, a delegation of Eastern lumbermen have journeyed to Ottawa to lodge a complaint with the Dominion Government. The delegation, composed of Messrs. A. P. Barmhill, K.C., George Cushing and Fraser Gregory, say that the American concern, known as the St. John Lumber Company, have built booms right across the St. John River to trap all the logs. This, it is claimed, is a violation of the Ashburton Treaty, which declares there shall be no interference with navigable water.

For Free Export of Tan Bark.

A large deputation representing the lumbermen and settlers of the Muskoka and Parry Sound districts waited on Hon. F. Cochrane, Minister of Lands, Forests and Mines recently, for the purpose of asking that the Government should remove the embargo against the export of tanbark to the United States.

The deputation which was introduced by Mr. John Galna, M.P.P., pointed out that there were at least 80,000 cords of bark in the Province at the present time, for which there was no market. Documentary evidence was produced showing that the tanneries of the Province and the Ontario Bark Company, all represented that they were overstocked with bark. Under these circumstances the deputation contended that there was no reason why the embargo against the export of bark to the United States should be maintained. They were of the opinion that if it were removed, a ready market for Ontario bark would be found at about double the price which is being offered in the Province at present. It was pointed out that the greater portions of the bark coming from the districts represented was brought out by settlers, and consequently the present condition of the market pressed hardly upon them.

Mr. Cochrane intimated that if

the prevailing conditions were as indicated he did not see why the embargo, which had been imposed by the late Government should be maintained, and he promised to bring the matter to the notice of his colleagues of the Cabinet.

The deputation afterwards decided to bring the matter of the freight rates charged by the Grand Trunk Railway on bark to the notice of the Railway Commission. The rates have been doubled in the last four years.

News of Port Greville, N. S.

At Port Greville, N. S., where lumbering activity is usually brisk, there has been a noticeable lack of vigor this winter and lumber operators are doing as little as possible. Last fall the prospect for good prices for the coming season was by no means bright. The English market was uncertain, while the American market was well supplied and the demand poor. The cut of sawn lumber in the neighborhood of Port Greville will this year not be nearly as heavy as in 1907, while the piling cut will be over 50 per cent. less. The following firms are operating to the extent mentioned:—

Fox River Lumber Company, one million feet for English market, and three thousand piling; H. Elderkin & Company, one million English deals, spruce and hardwood, now ready for English market, and three thousand spruce piling; F. K. Bently, six thousand piling.

At Port Greville ship building is an important industry, G. M. Cochrane being the largest builder. He is now constructing a tugboat, eighty feet long, eighteen feet wide and seven feet deep. In this the machinery is to be installed at once. Mr. Cochrane also has the frame up for a tern schooner, of about eight hundred tons capacity. The Fox River Lumber Company also have a tern schooner on the docks, of about six hundred tons capacity, which was completed in January, and will be launched this month. Captain G. E. Bentley has about completed and will also launch this month, an eight hundred ton tern schooner. L. E. Graham is building a coasting schooner, of about three hundred and fifty tons capacity, while contracts have been let for still another large tug.

Retention of Duty on Pulp.

On February 15 last representative Tirrell, of Massachusetts, advocated in the House retention of the duty on wood pulp and paper, and said pulp and paper manufacturers were now marketing their product at the lowest possible price consistent with the competition of the markets of the United States.

He protested strongly against the proposed removal of the tariff, and could see no reason why such action should be taken.

Spruce, Mr. Tirrell said, was the only wood from which strong, long fibre paper could be made. This wood was found in Maine, New Hampshire, Vermont, New York, Michigan, Wisconsin, Minnesota and West Virginia. The White Mountain forest reserve would take out 600,000 acres in New Hampshire, and in that event there would not be sufficient spruce left in the State to run the mill in Berlin without getting pulp and logs in Canada.

A Port Arthur despatch states that Mr. Milligan, superintendent for Hogan & Company, who have the contract for the building of the addition to the breakwater, expects active work on that structure will commence about the latter part of April, just as soon as navigation opens, 5,000,000 feet of timber being used in the cribs. His company, said Mr. Milligan, endeavored to procure this material in Canada, but it was impossible to get it in the time required. The contracts were therefore let to Michigan dealers, and it was supplied last fall, and is now all in storage on the breakwater.

Current Trade Conditions

ONTARIO.

Evidence of an acceleration in the lumber trade in Ontario is daily becoming more manifest. In the cities building permits are being taken out in surprising volume and just as soon as the weather is settled excavation work will be proceeded with. In Toronto from March 10th to 18th, there were 64 permits issued for dwellings, an average of 8 each day. This is certainly beginning to look like old times. In the smaller towns activity is slowly but surely awakening, and a good deal of lumber will have to move shortly. The only question now is the price. There is an unmistakable hesitancy about buying lumber in quantity, that arises from a fear lest prices may presently drop. In some centres lower rates have been openly or tacitly agreed upon. In Port Arthur, for instance, a new schedule of rates went into effect last week that means a saving to the consumers of 20 per cent. In most small centres there is no disposition to buy lumber until the trend of the season's prices is apparent. No one is going to pay a cent more for lumber than he actually has to.

A great part of the coming season's cut is yet to be sold, nevertheless, manufacturers refuse to make concessions on last year's prices. Middlemen are looking for these concessions, just as the retailer in his turn is expecting cut rates for the little he condescends to purchase. The indisposition of manufacturers to consider reductions has all along been the means of keeping prices buoyant. At this late date

it is unlikely they are going to submit when lumber will have to be bought. In places there may be local concessions, but on the whole, no shading of last year's rates will be possible.

EASTERN CANADA.

In most districts in Eastern Canada the logging season is about over and many camps have already shut down. During the past couple of weeks hauling has been general and preparations are being made for the spring drives. In northern New Brunswick operators report an unusually favorable season for bush work and on that account the cut on the Restigouche has been considerably larger than was first intended. In Cumberland county the contrary was the case, unfavorable conditions serving to keep the cut down to 75 per cent. of last year's total. The next few weeks will serve to indicate the probable volume of trade that will be done with the British and American markets during the coming season.

WESTERN CANADA.

Accompanying the preparation for spring seeding operations in Western Canada is a noticeable revival in almost all classes of trade including lumbering. At Vancouver the Royal City Mills, after practically three months of idleness, have resumed operations. Important shipments of big timber to Hong Kong and other Orient ports are being made by coast mills.

On the prairie efforts are being made, in many districts, to arrange schedules of prices that shall induce greater building activity. Retailers in the smaller centres are

getting together and declaring discounts that will materially lower the price of stocks. Moreover, owing to the difficulty experienced in making collections during the winter, an effort is being made to encourage the cash customer. This is working along the right line and should be productive of good results.

UNITED STATES.

In Chicago northern pine prices have declined during the past week, owing to the very quiet demand. Retail yard trade is said to be almost at a standstill. The opinion seems general that prices must drop still lower and buyers are not at all anxious about placing orders. Hemlock is in better condition and orders are coming in in somewhat satisfactory volume. The mills seem anxious to dispose of what material they have on hand and are consigning considerable stock with the result that prices are held down. This has also been due in a measure to the effort of the hemlock men to meet yellow pine competition. In this wood prices are still extremely low—in many cases not equaling the cost of production. New York market reports show a partial recovery in the spruce trade indicated by substantial inquiries and better buying.

A slight falling off in the demand for hard wood is reported from Chicago. Prices remain unchanged, although a tendency to weaken is noticeable on some of the grades of oak.

GREAT BRITAIN.

The general depression of trade which is felt in almost every branch of commerce is still having its effect upon the timber trade of the west coast. The spruce deal market keeps dull and the present position of that wood is not strong for general specifications of ordinary spot

shipments. Apparently there has been little or nothing done, as yet, for future business upon next season's shipments from New Brunswick or Nova Scotia. Stocks of spruce at Liverpool and Manchester area being slowly diminished.

The consumption of pine deals, boards, etc., is only about half that of last year and is confined almost entirely to the lower qualities. The extremely high prices required for firsts is almost shutting them out of the market and buyers are looking for cheaper substitutes.

B. C. Timber Licenses.

The total timber license fees collected by the British Columbia Government for the month of February amounted to \$160,317.15. This is more than double the amount collected in February of the preceding year, when the total was \$65,315.70.

In all 1,191 licenses were issued, 592 for limits, east of the Cascades and 599 for limits west. The total revenue from timber license fees for the first eight months of the present fiscal year, amounts to \$1,465,709.43, as compared with \$512,152.41 for the first eight months of the preceding year.

The revenue has fallen off decidedly, as compared with January. The receipts from this source for that month were the heaviest known, amounting in all to \$347,266.65.

The timber license transfer fees for the month, totaled \$820.

A Greatly Reduced Cut.

It is estimated that the Yale-Columbia Lumber Company have cut and will bring down the Kettle River, this spring, about 3,000,000 feet of lumber. This is only about one-fourth of the amount taken out last year.

THE NEWS

Desjardins & Ericsson, lumber dealers, Montreal, Que., have registered.

Ion Brothers & Company, lumber dealers, Montreal, Que., have registered.

A. J. Moore & Son, pulpwood manufacturers, Bulwer, Que., have registered.

The Stratford Mill & Lumber Company, Stratford, Ont., are reported to have assigned.

Damien Cyr & Son, sash and door manufacturers, St. Rose, Que., have dissolved partnership.

The British Columbia Timber Company have sold their stock of lumber at Seal Harbor to the Grand Trunk Pacific for \$35,000.

The boiler of a portable sawmill owned by Johnston & Son, Sarnia, exploded a short time ago instantaneously killing James Harkins, a lad of fifteen years, and seriously injuring two other employees.

The Miramichi Lumber Company operating in New Brunswick, with headquarters at Portland, Me., have increased their capital stock from \$800,000 to \$1,000,000, this increase being divided into 2,000 shares of \$100 each.

Messrs. Thompson & Griffiths, of Parry Sound, Ont., have established a planing mill and boat factory at that place. They will manufacture all kinds of dressed lumber, sash, doors, etc., as well as boats, canoes and gasoline launches.

The British Columbia Loggers' Association have settled upon a new schedule of wages, which is expected to prove satisfactory, since it is a medium between the extreme high and low wages which have prevailed during the past year.

Among the latest concerns to receive a charter are the Port Elgin Lumber Company, Limited, Port Elgin, Ont., capitalized at \$50,000. The incorporators include William McVicar, William Rutson, Gilbert McLaren and H. Hilker, all of Port Elgin.

The Fraser River Sawmills, New Westminster, B.C., have changed hands, and it is understood that large improvements to the plant will be carried out. The purchasers are E. E. and Louis Swift, Chicago; Peter Jensen, Nebraska, and Col. A. Davidson, of Toronto.

In connection with the formation of the Union Lumber Company, Winnipeg, capitalized at \$10,000,000, it is stated that another large mill will be erected in the near future. Among the incorporators of the new concern are J. S. Hough and G. F. Galt, of Winnipeg.

It is stated that several parties have staked timber near Alberni, and the indications are that they intend to start manufacture, as they are applying for permission to remove obstructions from the Stamp and Somas rivers. Wm. Allen, of New Orleans, La., is said to be interested.

There is promise of activity in the lumber industry near Grand Forks, B.C., and it is stated that Eastern people are going to erect mills to cut the timber lying along the north fork of the Kettle river. The Kettle Valley Railway is being extended, and this will give transportation facilities.

The Chilliwack Manufacturing Company, Chilliwack, B. C., have been organized, with D. B. Hall, president, and A. J. Robertson, manager, to go into the lumber business and the manufacture of fruit boxes. Besides fir and cedar, they have practically all the spruce timber available in the Ohilliwack Valley.

E. H. Heaps, head of the lumber firm of E. H. Heaps & Company, of Vancouver, was elected president of the Board of Trade of that city for the ensuing year. Before he took the chair, he seconded a resolution which urged the Dominion to place a duty on lumber coming into Canada at \$2 per M., and 30 cents per M. on shingles.

Smiley, Cohen and Groker, the latter of Minnesota, are building a lumber mill at Cloverdale, local and Minnesota capital being behind the venture. Cloverdale is on the direct line from the Coast to the Kootenay, which is being constructed by the Great Northern, and these men are preparing for an extensive business. The mill will be in operation in a month or two.

The Chicago Lumber & Coal Company have recently opened a purchasing office in Vancouver. The address is Room 1, De Beck Building. This concern is one of the oldest established lumber companies in the West, having been established in the year 1886. The headquarters are at St. Louis, Miss., and the principal Canadian offices are located at Winnipeg, suite 711-713, Union Bank Building.

J. B. Housser, of Portage la Prairie, and T. B. Patton, of Regina, are president and vice-president, respectively, of the Western Retail Lumber Dealers' Association for this year. At the same annual meeting, the Retail Lumber Dealers' Mutual Fire Insurance Company elected its officers as follows: J. A. Thompson, president; A. K. Godfrey, treasurer and vice-president; A. M. Stewart, secretary.

Messrs. Letson & Burpee, Limited, of Vancouver, have recently supplied "Simplex" shingle machines to D. Cook, of Lynn Valley, B.C., and Chas. Warwick, of South Vancouver, both of whom are starting new lumber manufacturing concerns. They have also supplied "Simplex" shingle machines to the plants of Pelletier & Selkirk, of Port Haney, and the Port Kells Shingle Company, Port Kells, B.C.

A despatch from Portsmouth, N. H., states that "on what may be considered good authority it is announced that Canadian parties are negotiating for the lease of the Publishers' paper plant for a term of years. It is understood that the people in Canada have a large tract of spruce wood timberlands, and if the lease is consummated the wood will be shipped to this city by water for pulp manufacturing."

The East Templeton Lumber Company are offering for sale their entire timber property, which consists of approximately 210 square miles of timber limits, a saw mill and lumber yard, a quantity of logs, mining lots, etc. This property is very valuable and will no doubt command the attention of lumbermen. Particulars regarding the property can be obtained from Messrs. Gormully, Orde & Powell, 33 Sparks street, Ottawa.

E. L. Kinman, John Brophy and the Imperial Timber & Trading Company, of this city, were successful in an action for \$6,500, which was claimed by Thomas S. Smythe, of Toronto, as part of the commission on the sale of timber lands on the north end of Vancouver Island to Senator Cox a few months ago. The company put the deal through, and Mr. Kinman invested \$20,000 in the concern. The profits were \$60,000. Peter Ryan, of Toronto, claimed the \$6,500, and assigned his claim to Smythe, who lost.

The Vancouver police recently arrested a Japanese named Yesmoda on the charge of stealing logs from the Rat Portage Lumber Company. Yesmoda was caught as he was bringing a big cedar log down False Creek in tow of a small boat. This arrest is an important one, for it may bring out further information concerning wholesale thefts of logs that have been going on in the vicinity of False Creek for two years past. Millowners report that they lose thousands of dollars' worth of logs annually. Booms are broken almost daily and logs taken. It is alleged that the Japanese gang of which Yesmoda is a member have places where they cut up the logs, and then sell them to the shingle mills.

Two mills are being erected on the south side of the Fraser river, opposite New Westminster, B.C. One is being built by Anacortes people, and the other by W. P. Fowle, late manager of the Fraser River Sawmills, Limited, and R. E. Nevins, who was also connected with this company. Lester W. David, who organized the Fraser River Sawmills, is also said to be interested. Mr. David has just disposed of his entire interests in this company and in the Anacortes Lumber Company, amounting to \$250,000. The principal men among the new owners are Swift Bros., pork packers, Chicago; Peter Jansen, Nebraska; Col. A. D. Davidson, Toronto, and A. D. McRae, Winnipeg. The mill is now being enlarged and will be the biggest of any in the province.

Mr. J. W. Stewart, of the contracting firm of Foley Bros., Larsen & Stewart, Winnipeg, has secured seven berths, covering an area of 330 miles of valuable territory between Peace River and Lesser Slave Lake. Mr. Stewart was the only bidder in each case, the bonuses ranging from \$500 to \$1,500, or a total of \$7,000 in all. The remoteness of the territory, coupled with the short notice by the department, rendered it impossible for any other tenderers to ascertain the value of the area in time to submit offers. Berth 1,238, a choice area of 3 1-2 square miles, on the Athabasca, was secured by Mr. Russell Blackburn, Ottawa, he being the highest bidder out of five tenders put in. Mr. E. J. Elliott, chief of provincial police at Winnipeg, secured berth 1,272, twenty-four square miles, on the Simonette river, for \$100, he being the only tenderer.

An important transaction has just been completed by Hon. J. M. W. Hall, Boston, president of the North American Land & Lumber Company, under which this company sells to the Seippel Lumber Company, of Dubuque, Ia., a large tract of timber in British Columbia covered with a very heavy growth of cedar, amounting to several hundred million feet. The new purchasers are now on the spot, having secured the tract with a view to immediately operating, and they are laying out saw and shingle plants, railroads, etc., and, when ready to ship, the product will be largely cedar shingles destined for the Eastern trade. Early last fall Mr. Hall gave orders to put in a full stock of logs, amounting to 10,000,000 or 11,000,000 feet, he having full faith in the future of the lumber business. He reports excellent conditions for logging, and they have a fine stock already for the spring, the ice basis making it possible to get out cedar from points they had been unable to reach before.

A law suit of considerable interest to the trade has just been brought to an issue at Calgary, where Breckenridge & Lund, lumber dealers, had entered an action against Judge Travis to recover \$5,185 on a mechanics' lien for lumber supplied for the erection of houses on sub-contract. The defence made a counter claim against the defendants for \$5,500 for damages for conspiracy to defraud. In giving his decision Judge Beck dismissed the case of the plaintiffs, and likewise the counter claim, leaving the question of the costs to be fixed later. Judge Stuart, in a recent case of Swanson vs. Mollison, held that the owner was liable to the lien holder for more than the contract price, but Judge Beck refused to follow this decision, stating that the owner cannot be held under any circumstances for more than six weeks' wages and under certain circumstances, and the owner does not have to see to the application of the moneys. The only regard an owner need have is to register lien or loans he has had written notice of, and he is entitled to hold back from the contractors' price certain moneys to compel his building in the event of the contractor refusing or neglecting to complete his work. This decision is contrary to the views of all Western lumbermen, and we are glad to note that the case will probably be appealed.

Personal.

Mr. R. G. Dinsmore, who has been associated with the Ottawa Lumber Company for the past four years in the capacity of yard superintendent and salesman, has severed his connection with that company to assume charge of the sales department of the James MacLaren Company, Limited, of Buckingham, Que. Mr. Dinsmore will look after the marketing of both the lumber and ground wood pulp manufactured by this well-known firm, and will no doubt meet with success in his new field.

Europe's Timber Supplies.

Russia's forests are of immense extent, covering 39 per cent. of European Russia, and 350,000,000 acres of Asiatic Russia, or more than 900,000,000 acres altogether. In the management of her forest wealth Russia must be considered a leader, for despite her tremendous forests, she began to guard against the future long before the need was apparent. As a result of this forethought, Russia derives a net annual income from forests of \$21,500,000. Sixty-three per cent. of Finland is timber bearing land, and yearly she exports \$20,000,000 worth of lumber. Protection in Finland is founded on the law preventing the cutting of timber less than 10 inches in diameter, 25 feet from the ground. Sweden has nearly 50,000,000 acres of forest, and ranks second to Russia as an exporter of timber, selling \$54,000,000 worth of lumber abroad, of which England takes nearly \$30,000,000 worth.

Germany has 35,000,000 acres of forest, but as her lumber bill is \$450,000,000 a year, she has to import \$80,000,000 worth. The percentage of woodlands to population is about the same in France as in Germany, about three-fifths of an acre per head. France also is an importer to the extent of \$30,000,000 annually, to which must be added \$6,000,000 for duty and \$10,000,000 freight. Even Germany has wood to sell to France. Ever since 1827 France has been protecting her forests, and the results have been highly satisfactory, although only in the nature of repairing damage wrought in the eighteenth century, when large areas were cleared for cultivation, on land, that was fit only for timber. Norway's 20,000,000 acres of forest supply \$18,000,000 worth of export timber every year; but the cut is at the expense of the forest capital, and if the present system is continued, disaster awaits Norway.

Austria administers her great forests wisely. She has 24,000,000 acres of commercial woodlands, and although only 7 per cent. belongs to the State, most of the private forests are in blocks of from 20,000 to 350,00 acres. On these large holdings, forest management can be practised with great success. The Government assists the movement toward protection and reforestation by a system of taxation that penalizes those owners who do not wisely manage their properties. It has been suggested that similar system might have good results in the United States, and it is not unlikely that President Roosevelt's programme will contain this feature.

A British Columbia College of Forestry.

Charles F. Lindmark, mayor of Revelstoke and manager of the Revelstoke Sawmills Company recently returned from an extended trip to Europe where he studied the methods pertaining to the preservation of the forests in Germany and Sweden. He states that under the present advanced methods of forest preservation in Sweden, even in spite of the large export trade from that country and the huge amount of lumber that is being cut annually, the timber resources are on the increase.

Mr. Lindmark gives it as his opinion that this phase of the lumber question that now confronts the people in this country is of the greatest importance, and that, if the present methods of slaughtering the timber resources without any effort to reforest continued, within a period of less than fifty years our timber resources will be seriously depleted. He says that some arrangements should be arranged between the Government and the lumbermen, whereby timber land that has been cut, and that is not fit for agricultural purposes, should be protected for reforestation.

Reciprocal arrangements between the Dominion and provincial authorities would undoubtedly provide for a college of forestry in British Columbia with the end in view of training the most competent young men to be selected from the lumbermen's camps throughout the province. This college, said Mr. Lindmark, would afford these young men theoretical as well as a practical education, and would qualify them as foremen and scalers, and give them, at the same time, instruction in reforestation.

Paper prices have to some extent responded to the advance in the cost of the raw materials, and the Norwegian and Swedish "News" makers are endeavoring to keep together as much as possible in order to carry out a rise in their products.

Eight Hundred Million Spools a Year.

Small things are not to be overlooked in considering the problems of the future timber supply. The watchmaker is having as much trouble in getting the grade of wood necessary for his business as the dealer in telegraph poles.

One of the industries which deals with small things, yet which is one of the utmost importance to the country's commerce, is the manufacture and export of spool wood. This business is peculiar to the New England States and is centered in Maine. Spool factories of this State, according to the New York "Tribune," are now turning out eight hundred million spools annually, with a market value of nearly \$1,000,000.

The best quality of timber is used for the manufacture of spools. White birch, which is used almost exclusively for this industry, reaches the factory in the form of bars from one-half to two and nine-sixteenth inches square and two and one-half to four feet long. These bars must be absolutely clear. The birch is cut in winter and sawed in small portable mills, which operate near some railroad line, about two and one-third cords being required for one thousand feet of bars. After sawing the bars are piled criss-cross, in order to facilitate thorough seasoning, and, protected from weather, are allowed to season until June. The spool bar mills of Maine turn out about fifteen million feet of bars during the year, and approximately the same amount of material is manufactured into spools in the State.

The machines for making spools are complicated and require skilled men for their operation. The spools drop from the lathe at the rate of one per second, and must be perfectly uniform and true.

Double Cutting Band Mills

This is a view of the Allis Double Cutting Band Saw Mill showing the Mill in a raised position for a large log. The mill is raised and lowered by a steam and oil hoist as easily as the guide is raised and lowered on the ordinary mill. The saw above the cut can be kept rigid and as short as possible at all times, and the surplus length of blade can be kept below the log instead of on top as with the ordinary mill. The Telescopic Band Mill renders practicable the use of a double cutting saw. (See Bulletin 1700.)

SOLE AGENTS IN CANADA

"QUALITY IS THE BEST POLICY"

"Goods Well Bought are Half Sold"

WE do not know the origin of this quotation, the truth of it, however, is thoroughly realized and universally accepted by retailers of all lines of goods.

"WELL BOUGHT" can be given a variety of meanings but the only true definition is—the best value for the least money. Some people believe "well bought" synonymous with "cheapest price" without regard to the value received. This is poor judgment and a disastrous business policy to pursue. The success of our "Quality" policy has proved to our entire satisfaction that the lumber trade of today are fully alive to the benefits derived from handling the very best.

We have by far the best facilities for manufacturing, drying and dressing Spruce, found in Canada. It takes time, money and infinite care to keep our standards at all times up to the required mark, but it pays in the satisfaction of our customers and ourselves.

Our Springfield, Mass., sales office will take pleasure in quoting on your requirements for Flooring, Ceiling, Partition, Novelty Siding, New Brunswick Cedar Shingles, Lath, etc.

**Reliable
Veterinary
Remedies**

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

Johnson's Horse Liniment No. 1.
A penetrating Alcoholic Liniment. Put up in one gallon jugs, with full directions, per imperial gal. \$4.50

Johnson's Horse Liniment No. 2.
A combination of the best oils used as liniments, imp. gallon . \$3.00

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic. Imperial gallon \$5.00

Johnson's Veterinary Healing Ointment.

Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . \$2.25
or in 1/4 lb tins, per dozen . . \$3.50

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb 30c.

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating liniment, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to \$100.

Send postal for printed matter.

R. H. SMITH CO., Limited

— St. Catharines, Ont. —

We are the Sole Manufacturers of Saws under the **Simond's Process** in the Dominion of Canada

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. All such Claims are FALSE, as the patentee in the U. S. and ourselves are the only firms in the world who use it.

INSERTED TOOTH SAWS

Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS

THE "NARROW LEADER"

REFINED SILVER STEEL.

The Simonds Temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

COBBS HIGH PRESSURE SPIRAL PISTON AND VALVE ROD PACKING

"Cobb's" Packing is especially adapted to withstand heat and highest pressure. The rubber core is oil and heat-proof and will not harden, but remain elastic indefinitely. The outside covering is made of material that is not affected by heat. The lubricant employed is the result of much scientific research and is absolutely free from grit or acids.

We make everything in rubber requisite for an engine room. The following are some of our specialties:

VULCAN SPIRAL PACKING, MAGIC EXPANSION SPIRAL PACKING, AMAZON HYDRAULIC SPIRAL PACKING, INDESTRUCTIBLE (WHITE), KARBONITE (BLACK) RUBY (RED), AND SALAMANDA SHEET PACKINGS, RUBY SECTIONAL CASKETS, GAUGE GLASS RINGS, DISCS, BIBB WASHERS, PUMP VALVES DIAPHRAGMS, PACKING RINGS, RUBBER BELTS, &C.

SIMONDS

Crescent-Ground Cross-Cut Saws

This is the identical Crescent-Ground Cross-Cut Saw which has for years been recognized as the best made or used in the United States. Since beginning the manufacture of these saws at our Canadian factories, we have found and are supplying a greatly increased demand throughout the Dominion. The Saws are made of Simonds Steel, and Simonds Steel is the best saw steel made. They run easy, cut fast and give good results. Sold by the hardware trade or direct from our offices.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOODWORKER is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., the CANADA LUMBERMAN AND WOODWORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO

— APRIL 15, 1908 —

MONTREAL

Cold Feet or Warm Blood.

It is a peculiar thing, which may have escaped the notice of those who run while they read, that conditions in the Canadian West have lately been acting and reacting, at a much more rapid rate than in the older districts of Canada. When hard times were threatened a few months ago the West suffered from "cold feet" before the rest of the country, and seemed to have appointed itself the special representative of blue ruin. It is natural that Westerners should have seen danger ahead, sooner than most people, for they live next door to the crop situation, and are able to size it up a little sooner than the rest of us. The peculiar part of the situation is the rapidity with which the reaction has set in and "cold feet" have been succeeded by "warm blood." To-day the West has taken upon itself the work of heralding in advance the growing financial improvement. In the older parts of the country Canadians are more conservative and are recovering more slowly from the recent depression. But they never seem to go slowly in the West. Reports from all sections indicate that everyone there is trying his best to forget the anxieties, just as readily as he formed them.

It is easy to find causes for the rapidity with which the West changes from optimism to pessimism, or the reverse. The crops are as yet the backbone of the country, and are the prime factor in the regulation of financial conditions. But there are other factors of great importance to-day. The creation of the two new provinces of Alberta and Saskatchewan has gone a long way towards assisting the improvement. The new provinces have the all interesting problems of the future to handle. They have the task of building themselves up at a much more rapid rate than has been customary in the older provinces. Their natural growth would have been rapid, whether they were created into provinces or not, but under the new conditions the natural buoyancy of youth has been given an added impetus.

Increased railway construction has much to do with the ability of the West to overcome its troubles so rapidly. Three great railway corporations are exerting every muscle and nerve to spread themselves all over the country. They recognize that the future belongs to the company which is soonest in the field, and their construction is counted now by hundreds of miles, where formerly it was only in tens.

Every town and hamlet is sending out a story of expansion. When the railway reaches a locality it finds it already discounting the arrival, and learns of the growth of places far in advance, where as yet the road is only a thing of the future.

Loan Companies Want Too Much for Their Money.

What does all this mean? More than anything else, it means work for the railway builders and expansion for the whole country. It means the circulation of money, which would otherwise be tied up in banks and loan companies. The liberation of money for circulation is the only way to overcome financial trouble, and if the West is to realize the prosperous summer it is now hoping for, money must be set loose. This part of the situation must not be overlooked. However anxious we may all be to see good times come as soon, and as substantially as possible, we cannot force them of our own motion. Everyone can do a little individually to help things along, but if we have to face indifference or disinclination on the part of others, it makes the task almost impossible. The situation in the West just now is generally acknowledged by business men to be safe. But the banks and loan companies are slow to reflect the feelings of the business community. They have not as yet loosened their purse strings as extensively as business men think they should. The result is, that although the opportunity is present for renewed business activity and the merchants are waiting anxiously for a chance to go ahead, the credit institutions are charging too high a rate of interest to allow them to start. Building operations in particular are being delayed by the refusal of the loan companies to reduce their rate below 8 per cent. In other countries, and in Eastern Canada too, the rate of interest has fallen materially of late. It is difficult to see why, at least a proportionate decrease should not take place in the West. A reduction of the rate even to 7 per cent. would go a long way towards remedying matters. It is hard to imagine why even a rate of 6 per cent. cannot be safely made when one considers the low rates in operation elsewhere. Most authorities are agreed that a reduction will take place in the course of time, but business does not like waiting on the course of time, especially in the West. If the loan companies can possibly see their way to it, it is their duty to lose no time in lowering the rates. A reasonable rate to-day will do much more than a lower rate a few months hence, when it will be too late to commence building operations. The lumber industry is vitally interested in this question, as the retail buyers are watching the course of events closely. If money loosens building operations will revive and the demand for lumber will expand. Without the cheapening of money all the confident expectations now being formed for a good summer will be disappointed. No one doubts that the loan companies are studying the situation as keenly as anybody else. If they will only quickly come to the same conclusion as the rest of the public, they will find themselves benefited as much as anybody else by the increased industrial activity.

It is fortunate for the West that the great railway corporations are already supplied with sufficient money to enable them to carry on their building operations without hindrance. Their confidence in the future of the West is unbounded, and they are doing much to offset the diffidence of the loan companies. This is leading to a great deal of building activity in the larger centres. Winnipeg in particular is feeling the stimulus. The district, there, to be effected by the entrance of the G. T. P. is experiencing a strong advance in prices. Most property owners are holding on tightly in the expectation of making good profits. In a short time new buildings will be planned, and the demand for materials, lumber among them, will be strengthened. The same holds true in regard to countless other places in the West, and it seems almost as though the loan companies may be forced to see the logic of the situation.

Pulpwood Cutting on the T. & N. O.

Activity is the order of the day along the T. & N. O. Railway line. "Everything is humming," said Chairman Englehart, of the T. & N. O. Board, referring to the cutting of pulpwood, the lumbering and mining operations. He estimated that as much as 50,000 cords of pulpwood would be taken out this year along the line of the railroad. Mr. Englehart also emphasized the importance of the northern country as an agricultural district. The train service to Matheson is now a tri-weekly one, and if the traffic warrants it the number of trains will be increased.

Does it Mean Confiscation?

Holders of Dominion timber lands are very much concerned about the new regulation of the Dominion Government, requiring that all holders of Dominion timber lands under lease, must cut from each square mile section one hundred thousand feet of timber each year. To prevent the necessity of erecting a mill where it is not convenient to do so, the government on a request being made to it, will permit the logs to be sold to another mill.

The lumber manufacturers and the Board of Trade of Vancouver have taken the matter up vigorously, but it is feared that their efforts will be of little avail. The government has signified its intention of enforcing the rule. The new regulation is a hardship on those holding Dominion timber. In many cases these limits are far apart. In one instance the sections of a leasehold are five miles apart and to operate the third section a railway would have to be built and a camp installed. If the section is not worked to the extent of 100,000 feet a year, the leaseholder has no option but to give up his property.

Some leaseholders have timber births that are not being worked and are worth \$35,000. They will feel pretty badly treated. The hardship on the leaseholder is more apparent when it is considered that he has purchased the limits in good faith, anticipating no alteration of the laws and has expected to benefit by the accrued value of the lease. The motive of the government is said to be to compel anyone holding leased timber to cut it and thus to throw so much timber on the market as to make it a cheap commodity for the farmer. Mill owners consider this an unfair burden upon themselves and believe the farmer has already sufficient advantages in the form of competition by United States rough lumber, and protection against imported grain.

All Looks Rosy in the West.

Quietness characterizes the western lumber trade to-day, but it is not expected to be of much longer duration. Mr. W. W. Davidson, a lumber dealer of Moosejaw, Sask., when at Vancouver recently said "Manufacturers have no cause for entertaining any pessimistic feeling respecting the outlook. I look for a big revival before July in view of the influx of settlers to the new provinces. Lumber dealers were hard hit by the partial failure of crops last year. It is a safe calculation that at least sixty per cent. of their sales still remain unpaid for by the farmers. Apply this condition to every town and hamlet in the prairie country and it will be evident that these obligations in the aggregate will represent an enormous sum, easily over one million dollars. A reduction averaging about fifteen per cent. has been made in the prices of rough lumber, which now sells at about \$28 of \$29 per thousand. These figures look large but the margin of profit is limited. As far as I can make out the initial cost of getting out the logs is too high. To that must be added the charges for sawing, a profit to the millmen and railway freight rates. But in any event the newcomer must have lumber.

"The demand for lumber will assume large proportions this summer owing to the enormous influx from Europe and the United States. The movement from the United States started three weeks ago. Hundreds of settlers are crossing the border every day. Saskatchewan is securing a large number, but thus far the movement to Alberta has assumed bigger proportions. The depression due to last year's poor crop is passing away and the old-timers are looking forward with confidence to the future. These unfavorable conditions are not likely to occur again for many years. It speaks well for the country that it withstood the strain and that this spring's influx will surpass all former records."

Another Log Hauling Engine.

The recent description in THE CANADA LUMBERMAN of "The Northern Express" log hauling train, has resulted in a number of communications being sent in, describing similar trains in other parts of Canada. The latest is a picture postcard, depicting one of these trains, owned by Mr. T. M. Craig, of Sherbrooke, Que. It is operated by him in the Megantic district, and the picture shows it hauling 60 cords of 4 foot pulpwood. The weight of the load is 200,000 pounds and the weight of the sleds, etc., is 55,000 pounds. It hauls this load a distance of 10 miles.

A Plea for Pulp Export Duty.

Mr. E. N. Lewis, M. P., (West Huron) addressed the Canadian Club at Toronto last week, upon "Pulpwood and Paper Problems." The pulpwood problem, he said, resolved itself into this question: "Is Canada to go on exporting, in ever-increasing quantities, a great natural asset in its practically natural state, or is she to take such action as will result in its manufacture within her own borders, and thus have many millions of dollars paid to Canadian labor, in place of United States labor?" He believed it was possible to have the wood manufactured in Canada, and this being so it was our duty to have it done. If the facts were properly placed before the farmer who has pulpwood for sale, he would see that he would be helped by an export duty more than anyone else. The sale would be just as great, and more people would live in his neighborhood, to use his other products and make his farm more valuable. If an export duty were to be put in force, sufficient mills could be removed or built in Canada in 18 months to supply the world.

The pulp and paper industry gave more healthy and steady day and night employment to a large number of men and women at higher wages all the year round, than any other industry in Canada. Take the case of Grand'Mere and Batiscan, mere villages, originally each about 300 population. Grand'Mere manufactured 100,000 cords of pulpwood into paper and had a happy, thriving population of five thousand souls. Batiscan exports over 200,000 cords of pulpwood to the States, and has only 300 inhabitants.

We have no desire to prevent Americans from having newspapers, but let them get our forests in the shape of the manufactured article. When the Liberal Government of Ontario restricted the export of sawlogs, sawmills started humming in all directions, factories followed, the United States sawmills men came over here, and we were glad to have them. We would welcome the paper manufacturers also.

As an object lesson Mr. Lewis referred to Japan which import 5,000,000 pounds of British paper and 850,000 pounds of American paper; Canada was not mentioned. England imported \$28,369,075 worth of paper, principally from the United States. Where did she get her wood pulp? From Canada. Yet Canada was not mentioned.

As to the question of retaliation by the United States in case an export duty were placed on the Canadian raw material, Mr. Lewis thought there was nothing to fear. The press of the United States must have paper. They would probably make a vigorous fight against any proposal to place an import duty on Canadian paper. To Canada an export duty on pulpwood would mean an increase of \$6,000,000 in the profits and earnings of Canadian manufacturers and employees, for that was the estimated receipts of the 761 mills of the United States. To-day there were in Canada only 58 mills.

Foreign Enquiries for Woodstuffs.

The following inquiries for wooden goods have been received at the office of the Canadian Manufacturers' Association

R. Hamburger, buying representative of B. Singer & Company, a well-known firm of manufacturers' agents in Australia, well recommended by the Canadian Trade Commissioners, will shortly visit Canada with a view to establishing connections with manufacturers who can export carriage wheels, carriage wheel material, chairs, dining and household, office desks, and picture mouldings. This is a good opportunity for Canadian firms to establish satisfactory connections. Mr. Hamburger's present address is care the Waterbury Clock Company, 47 Maiden Lane, New York City. He has good Canadian and United States references.

Lumber, Spruce, Pine and Cypress, dressed and rough—A large firm of lumber dealers in San Juan, Porto Rico, are open to place orders for cargo lots of this lumber; delivery to be included to seaports in Porto Rico. Will purchase or sell on commission, paying cash or time. In the latter event against secured payment. References, the Bank of Porto Rico, San Juan. Address, A. A. David, San Juan, Porto Rico.

Manufacturers' Representative Mr. M. M. Pines, 24 Sienna, Varsovie, Russia, is open to represent Canadian exporters of lumber and other produce in Russia.

Saw Mills—An inquiry has been received from Mr. Edward C. Keefer, C.E. E. de F. Sao Paulo, Rio Grande, Ponta Grossa, Parana, Brazil, for small saw mills suitable for work in Brazil. Quotations should be made c.i.f. Rio Janiero, and sent to the above address.

The Labor Question of the West.

There is no doubt that there will be an unprecedented demand for labor in the west this year. At least thirty-five thousand men will be needed for railway construction work. Foley, Welsh & Stewart alone will absorb 12,000 men west of Winnipeg on the Grand Trunk Pacific contracts. J. D. McArthur & Company, will employ five to seven thousand east of Winnipeg. Building operations in the towns and cities will also require a considerable number. The new union depot in Winnipeg will require a thousand men, and the massive parliament buildings, to be put up in Edmonton and Regina, a like number. In Winnipeg there is plenty of skilled labor of all classes, and there is not any likelihood of a scarcity for some time. This is due to the fact that Winnipeg is the "jumping off" place for all new comers, who, instead of going further west, seem to like the bustle of the city. Wages for skilled workmen in Winnipeg will be the same as last year. Where the immense army of workers required for the harvest is to come from is a conundrum, as railway construction will absorb the ordinary immigrants. Cheap excursions from the east will prevail, which combined with high wages may possibly attract the twenty or twenty-five thousand required by the farmers.

One of British Columbia's Model Plants.

One of the most active concerns in New Westminster at the present time is the British Columbia Manufacturing Company, Limited. This concern, which was carried on by Mr. Eckhart, for many years, is now owned chiefly by Mr. W. Finch-Page. Since the change of proprietorship last year, many alterations and improvements to the plant have been made, the capacity of which has been trebled. Among the new machinery installed, is a Merzhom band resaw and a new woods planer. The power plant was augmented by the installation of a 72 x 18 foot boiler 125 pounds pressure, supplied by the Vulcan Iron Works, and a Hewson Stanwood & Gamble supplied by the Fairbank Company. The chief products of this concern are, wooden boxes for fruit, butter and fish, and for all other purposes desired, also veneer fruit baskets. Everything is done at the plant, the logs being cut up and manufactured into the different products on the premises. The manager of the plant is Mr. A. M. Westall, who was for many years in charge of the box-making plant of the Brunette Saw Mills at Sapperton.

Their Goods Are "Too Good."

Economy of fuel is a serious problem for the woodworker. The blast grate however, goes a long way towards providing an ideal solution. The Gordon Hollow Blast Grate Company of Greenville, Mich., recently obtained an eloquent approval of their product, in a brief letter from Lang & Brother Manufacturing Company, Farmington, Mo., to whom they had written in an effort to sell them some of their grates. The reply was as follows: "We have a set of your grates which we bought of you about fifteen years ago. They are all right yet. You should not make them so good if you want to sell more to us. We sell about \$5 worth of slab wood every day we run, which formerly we had to burn to make steam".

The use of southern pine is reported to be affecting the demand for sawn lumber of all kinds in the Ottawa valley. Consequently the consumption of other sorts of lumber is falling off. Owing to difference of opinion as to how last year's high prices will be maintained during the coming summer middlemen and manufacturers are slow coming to terms. So far large sales have been confined to deal and the British buyer has been able to get substantial reductions on some lines. Lumbermen have not received reports for the season's cut of logs, but the estimate in the early winter that the falling off would amount to about 25 per cent seems to have been borne out. This circumstance, however, will not reduce the mill cut next summer except with small producers. A few of those whose output last year was nearly 100,000,000 have enough logs in the river to feed their mills without touching last winter's cut in the woods.

B. C. Embargo Removed on Low Grade Logs.

The course decided upon by the British Columbia Government in regard to the export of the poorer grades of logs, now in the water, will make things quite lively for a few months to come. Owing to the reported failure of the British Columbia market for the poorer grades strong representations were made to the provincial government to the effect that the embargo upon the export of these logs should be removed. It was pointed out that not less than between 125,000,000 and 150,000,000 feet of logs are now in the water on the coast and that there was a market for them on Puget Sound. Unless permission to ship them there was granted it was claimed that at least \$500,000 worth of logs would be eaten by the teredos. After enquiry the government decided to remove the embargo, in regard to all poorer grades now in the water. The order is already in effect and has been taken advantage of, one boom having been despatched to Puget Sound. In a few days the rush of logs to the American mills will be in full swing and there will be a continuous string of booms from Broughton Island to Port Blakeley. Before exporting, a certificate that the requirements of the government have been satisfied has to be secured from Mr. A. Haslam, supervisor of log scalers.

It is not the intention of the government that No. 1 fir logs, free from teredo action, should be exported. There is ample demand on this side of the boundary line to care for all the first class fir logs, and none will be permitted to be shipped to Puget Sound. A good demand for the poorer grades exists among the Washington State mills. The result of the permission to export will be immediately felt in Vancouver. The towboat fleet, which for some months has greatly felt the loss of employment, will have all the work it can attend to for some months. With the poorer grades of timber out of the way, logging camps will be reopened with larger forces of men, and many of the unemployed will be in the woods much sooner than expected. The loggers will be able to pay their bills much more readily, and they and allied interests will feel the spur of the immediately improved conditions.

The removal of the embargo is causing general optimism in lumber circles. An early result will be the circulation of some Sound money, the settlement of loggers' liabilities and the renewal of operations in the camps. A secondary effect will be a stiffening of the prices for logs of the better qualities, which will have a tendency to settle lumber prices on a basis which will be regarded as assured for some time to come. Lately the industry has been beset with the fear that the overproduction of logs of last summer would cause a general slump, and this has had a paralyzing influence on operations. Now that it is possible to dispose of the surplus without heavy loss, the situation has materially improved from the point of view of the producer.

Conditions Improving in the West.

Speaking of present conditions, Mr. Henry Schaake, manager of the Schaake Machine Works of New Westminster, recently stated to THE CANADIAN LUMBERMAN that they found a great improvement during the month of March, over the previous month. The foundry and pattern shop had been running for some time up to full capacity. The machine shop had nearly the full crew on, the work being for shingle and saw mill machinery, mostly odds and ends and repairs for the many mills. "Mills in general," said Mr. Schaake, "seem to be doing more overhauling than rebuilding, though we find some of the smaller mills are adding new machinery. We have recently completed installation of the full saw mill equipment for Chas. Warwick, which will be located in South Vancouver. This mill will have a capacity of 25,000 feet per day. We are also fitting up complete, a new shingle mill in South Westminster, for Alfred Turner. This equipment includes two of our Johnson Schaake shingle machines."

Machinery says there is a growing tendency to leave off all ornamental finish on manufactured machinery. Thirty years ago wood-working tools were painted in bright and variegated colors; today practically but one color is seen, and that a color that, contrasted with the finished bright work of the moving parts, is much more pleasing to the eye and in use, than the coat of many colors.

Haskell Lumber Company's Operations.

SCENE ON HASKELL LUMBER COMPANY'S LIMITS.

The Montreal Standard recently published an article entitled "The Month of March in the Canadian Woods", illustrated with views of the lumbering operations of the Haskell Lumber Company, Limited, of Fassett, Que.

The pictures give a good idea of the different operations which take place in the woods in the closing days of the winter. Two of the pictures showed the logs and hemlock bark being hauled to the piling grounds along the railroad which is owned and operated by this company. One of the pictures, which is reproduced here, shows a typical lumbering camp of this section. Three pictures are devoted to the work of the log train hauling the logs from the piles along the track and delivering them to the pond at the mill, situated on the Canadian Pacific Railway on the north shore of the Ottawa river. Another picture which is reproduced here gives a comprehensive idea of the part a railroad plays in these

lumbering operations. A steam log-loader is loading a train of hardwood logs and near it is a huge stock of bark from which a car is being loaded. On an adjoining switch, to one side of the picture, a small crew of men are shown unloading a car of oats for the camp nearby. The weekly supply train is just coming into view at the other side of the picture, while in the background and nearly everywhere are piles of logs.

The Haskell Lumber Company Limited have also a new modern mill where they have been sawing hardwood all winter. In their yard they have some fine looking lumber including oak, ash, elm, basswood, butternut, birch, maple, and beech together with two or three million feet of pine, spruce and hemlock, besides lath and shingles. They expect to saw about ten or twelve million feet of hemlock, pine, spruce and cedar this summer. They curtailed their winter's cut of logs about 40 per cent. on account of the expected dullness of the market as a result

SCENE ON HASKELL LUMBER COMPANY'S LIMITS.

of last October's money stringency. Besides the sawmill this company have a well-equipped planing mill run by electricity and are able to supply all kinds of planed and tongued and grooved lumber, such as flooring, ceiling and novelty siding.

Canadian Forest Engineers Organize.

The Canadian Society of Forest Engineers is the latest addition to the ranks of engineering and forestry societies. It is designed primarily for professional foresters, and its organization is a striking evidence of the advancement of forestry in Canada, the number of men engaged professionally in forestry work having so far increased as to render expedient the formation of such a society. The object of the society is "the advancement of its members in the theory and practice of forestry by the discussion of technical and professional topics, the promotion of a better mutual acquaintance among Canadian foresters and the cultivation of an esprit de corps among the members of the profession."

The formal organization of the society was effected on Friday evening, March 13th., when a number of professional foresters assembled at an informal dinner at the Place Viger Hotel, Montreal, at the close of the meeting of the Canadian Forestry Association. There were present as guests, Mr. Overton W. Price, Associate Forester of the United States Forest Service; Professor Filibert Roth, head of the Department of Forestry at the University of Michigan, and Professor Hugh P. Baker, of Pennsylvania State College. The others present were: Messrs. E. Stewart, former superintendent of forestry for the Dominion; Dr. Fernow, Dean, and Mr. A. H. D. Ross, lecturer, of the Faculty of Forestry at the University of Toronto; Mr. Thos. Southworth, superintendent of colonization, Toronto; Mr. W. J. C. Hall, superintendent of forest protective service, Quebec; Mr. Abraham Knechtel, inspector of the Dominion forestry service, Ottawa; Mr. E. J. Zavitz, forester of the Ontario Department of Agriculture, Guelph, Ont.; Mr. Ellwood Wilson and Mr. Marshall C. Small of the Laurentide Paper Company, Grand'mere, Que.; Reginald R. Bradley, of the Miramichi Paper Company, N. B.; G. C. Piche, forester to the Department of Lands and Forests, Montreal, and F. W. H. Jacombe, technical assistant, Dominion forest service, Ottawa.

After dinner a toast-list was honored, Mr. Ellwood Wilson acting as toast-master. Among the speakers were Professor Roth, Dr. Fernow and Messrs. E. Stewart and Thos. Southworth. The constitution, drafted by a committee appointed at an informal meeting on the previous evening, was read, and with some amendments, adopted. The election of officers resulted as follows: President, Dr. B. E. Fernow; Vice-president, Mr. R. H. Campbell; Sec.-treasurer, Mr. F. W. H. Jacombe, of the Forestry Branch, Department of the Interior, Ottawa.

Four classes of members are provided for: honorary, active, student and associate. Active membership is confined to those engaged professionally in forestry work in Canada and student membership to Canadian students in schools of forestry. To be eligible for associate membership a candidate must be "connected with the practice, teaching or administration of forestry, the lumber industry or other industry dealing with wood products." Meetings are to be held annually at the time of the Canadian Forestry Association's meeting and at such other times as the society may appoint.

The society commences with a membership of thirteen. It is designed to occupy among Canadian foresters a place similar to that which is filled in the forestry service of the United States by the American Society of Foresters.

Tan Bark Embargo Removed Till September, 1908.

As a result of the representations made to Hon. Frank Cochrane, Ontario Minister of Lands, Mines and Forests, by a number of tan bark producers of Ontario, the Minister has decided to remove the embargo on the tan bark until August 31st, 1909. When that date arrives the Government will decide upon its future action. The tan bark producers have been opposed in this matter by the tanners, a number of whom recently called upon the Minister and protested against the proposed removal of the embargo. Mr. Beardmore, on behalf of the tanners, claimed that the glut of tan bark in Ontario only amount to 15,000 cords

instead of 40,000, as the producers had claimed. The tanners presented a resolution protesting against the depletion of Ontario's bark supply in meant \$5.50 spent on labor. While this deputation was presenting its side of the case to the Minister a deputation of lumbermen and settlers happened along, and were granted permission to present their side of the case at the same time. They managed to persuade the Minister that their side of the case was more urgent than that of the tanners. Hon. Mr. Cochrane remarked that the tanners admitted that they were overloaded with bark. Therefore it was unfair and selfish of them to ask the settlers to carry this bark until they themselves could take it up. The evidence, he thought, showed that there were 40,000 cords ready for shipment. The tanners sought to explain the situation by stating that the reason they were unable to use the bark was that they were not at present tanning so much leather as formerly. Hon. Mr. Cochrane took this as an avowal of the strength of the bark producers' claims and accordingly decided to remove the embargo.

New British Columbia Lumber Association.

A well-attended meeting of lumbermen located on the northern coast of British Columbia was held at Port Essington on Saturday, March 7th, the object being the formation of an association among the lumbermen of that district, and to confer on matters connected with the local lumber interests. The position of chairman of the meeting was ably filled by Mr. R. G. Cunningham, of the Cunningham Lumber Mills at Port Essington. The following gentlemen were elected to office: Hon. president, J. M. Mackinnon, of Vancouver; president, W. B. Stephenson, of Prince Rupert, manager of the British Columbia Tie & Timber Company, Limited; vicepresidents, R. G. Cunningham; Capt. E. McCroskie, of Hartley Bay, manager of the Hartley Bay Lumber, Timber & Trading Company, and G. S. McTavish, of Rivers Inlet, owner of the saw mill at that place; secretary-treasurer, C. A. Dunlap, of Prince Rupert, of the British Columbia Tie & Timber Company, Limited. It was resolved to register the association under the name of the Northern British Columbia Lumber Manufacturers' Association.

A committee was appointed, consisting of Messrs. Stephenson, Lothian, Peck, Flewin and Brown, to make out a schedule of the different grades of lumber. A long discussion on logging was indulged in, and much valuable information elicited from the different speakers. Mr. Craig, a visitor from Tacoma, addressed the meeting at considerable length, giving copious information and illustrations relative to lumber methods adopted in the Seattle-Tacoma district. His address met with hearty appreciation. The meeting adjourned to meet at the call of the president.

An Important Lumber Judgment.

A judgment of much importance to lumbermen and lumbermen's contractors has been given out in the Hull Superior Court. According to the judgment, when a contract is given to deliver logs on a creek or stream it means that the logs are to be placed on the river and not on the bank of the stream. The case was that of Edward Matia, alias Jollicoeur, and Fred, Marleau versus the Low Lumber Company. The plaintiffs had the contract to deliver a certain number of logs on Stag creek. The logs instead of being delivered on the ice were left on the river bank and the contractors claimed that this was where the contract called for. The company had again to pay for transporting the logs to the ice and kept a sum of money out of the plaintiffs' contract. They protested and entered action for the full amount of their contract. Mr. George C. Wright was the attorney for the company which was successful in the case, as the action was dismissed with costs.

Perhaps no one subject that interests wood-workers has received more attention the last year or two than glue and gluing. Evidently some manufacturers who use glued-up stock should give the subject still further attention. It is a mighty item in the wood-working industry, and on its quality and application depends the success or failure of many a plant.

Market Correspondence

Industries Increasing at Ottawa.

Ottawa, April 9.—Manufacturers of lumber are holding out firmly for last year's prices and at present there does not appear to be much prospect of a reduction on them. It looks as if exporters in many cases were not going to make large purchases of thin lumber, buying only as they require it. There will probably be still an increase in the export of this sort of lumber to the Old Country following that of last year. Many export yards are so well filled with last year's product that there will be no room for the 1908 mill cut until transportation by water begins, which is expected in a month. Shipping is extremely dull at present, but there is a sign of improvement in the increasing number of inquiries from the United States. The market for pine is expected to continue steady, with possible advances in middle grades. The trade in birch is characterized as slow, and in basswood, active.

The quantity of 1 and 1 1-4 inch lath turned out of Ottawa valley mills is very large, compared with a year or two ago. J. R. Booth and the W. C. Edwards Company are now making this kind entirely, while Fraser & Company have a market for nearly all the 1 1-2 inch lath the mill produces. The lath trade is dull and mill men are watching with great anxiety what will be done with regard to prices with the 1908 cut. No. 1 white pine lath 1 3-8 inches has remained firm at \$4, but there have been some reductions in the inferior grades of the 1 3-8 lath. For instance, No. 2 white pine sells at about \$3 and the spruce and red pine mill run at about \$2.75. The 1 3-8 width nearly all goes to the United States. The 1 inch lath in these varieties is from 50 to 75 cents cheaper.

In a corresponding manner to the lath situation, the best quality of shingles remains at a firm price, while common grades show a weakening. Pine shingles have advanced 25 cents, and many sales have been made at \$3.50 per thousand, while white cedar is in active demand at \$4.

The log drive is absorbing the attention of lumber men, being next in importance now to closing the contracts for sawn lumber. The practice of grading men and paying very high wages to the most skilful has given such good results in the past that lumbermen are nearly all adopting it. Consequently, from \$45 to \$55 per month is being paid to skilful men whose records from year to year stand high. From careful observation of river operations, J. R. Booth and other lumber kings have ascertained that an expert river driver can easily be as good as two or three mediocre men. On the whole, it is estimated that wages are 10 per cent. lower than last year. Men are plentiful and the medium class is hired at from \$30 to \$35 per month, depending on the duration of their jobs and the distance from home. The men sent from Ottawa so far have gone to the Sault and they are paid from \$35 to \$40, while last year they drew from \$38 to \$45. On some short creeks as high as \$2 to \$2.50 per day will be paid this year, at least, where men are given only a couple of week's work. It is found that a large number of men thrown out of employment during the winter remained at Sudbury and other towns and are available for that district. Wages for Black River, Coloungue and Des Moines are \$30 to \$35 for ordinary men. The drive will be late.

Messrs. Shearer, Browne & Wills, Montreal, whose works on the Lievre river are objected to by other lumbermen and steamboat owners, have just made what appears to be an important move. The company have purchased a farm adjoining the disputed piers and booms for \$7,000, which it claims gives it practical ownership of the river's bed in that locality, half of which, according to the statement, belongs to the owner of the property along the shore.

Further reports from Ottawa state that few contracts have yet been made for thin lumber. It is reported that manufacturers of the Georgian Bay district have promised a reduction from last year, and buyers expect that Ottawa manufacturers will have to do likewise. Still, several manufacturers here assume a firm attitude and contend that there is no reason for reducing any of their quotations of 1907. In the first place

they have greatly curtailed the winter cut of logs, and they state that the winter has been very expensive for taking out logs.

The ever-advancing price of pine, especially in the middle classes, is improving the prospects for spruce and hemlock trade in this locality. Hemlock remaining firm at from \$14 to \$16, mill run, culls out, is regarded as very significant, as some years ago not more than \$6 per thousand was available.

... Hemlock has been sent from Ottawa to the New York market at as high as \$20 per thousand, which convinces local men that it is becoming greatly used as a substitute for pine. For building in Ottawa and vicinity hemlock and spruce have also been eagerly sought.

J. R. Booth has brought down about 2,000 cars of logs by rail, and they are lying on the ice to be manufactured at the earliest convenience.

There is a big demand for railway ties, of which the Booth establishment turns out about 100,000 a year. These are all used on the Grand Trunk Railway system.

Timber Famine Predicted.

The exhaustion of the supply of tie timber in a little more than a decade, and a pine famine in 20 years, were predicted in a paper read before the meeting of the Ontario Land Surveyors, at the Parliament Buildings, recently, by Mr. J. F. Whitson, of the Surveys Branch of the Department of Lands and Forests. This contingency, the author of the address contended, could only be averted by action to protect the forests.

Mr. Whitson discussed the consumption of railway ties in Canada, where there were 27,600 miles of railway. The demand was for 12,000,000 ties a year, and the average life of a tie was seven years. In Ontario, according to the present rate of construction, the railway mileage would be increased in five years to 9,000, requiring 4,000,000 ties annually, or from 26,000,000 to 32,000,000 feet, board measure. The demand was increasing, and the supply was diminishing. "Our duty as a business proposition is to protect the timber forests of Northern Ontario and to find some method whereby the life of a tie will be prolonged," said Mr. Whitson.

In the Rainy River and Thunder Bay districts there were 25,000,000 acres of land bearing jack pine, spruce and small tamarack, which if properly protected, would produce millions of ties. In addition, there were 5,000,000 acres in Algoma and Nipissing and other districts, making in all 30,000,000 acres, under licenses or on agricultural land, which could be made tie-producing. With the present cut there would be a famine in 12 or 15 years. Outside the forest reserves, there were 70,000,000 acres of land producing timber, of which 40,000,000 was virgin forest, and 30,000,000 had been burned over. The annual growth should be 3,500,000 cords, worth, at 60 cents a cord, \$2,500,000 a year.

The forest reserves included 10,500,000 acres of land, and on the Crown Land there were thirteen billion feet of pine still standing. On lands under license there were several billion more. The annual income of the province was about \$1,500,000, and the annual output 750,000,000 to 900,000,000 feet of timber. "At the present rate of cutting, this would almost indicate a pine famine in 20 years. With proper provision the annual growth should meet all future demand," asserted the speaker.

Beyond the height of land there was an immense area of pulp wood forest, through which the Grand Trunk Pacific would run, and divided by seven great rivers. These would serve to float logs and to supply water power. The annual growth, if protected from fire, would produce more pulp than would meet the demand.

As Others See Us.

Messrs. James S. Elliott & Son, dealers in lumber, lath, etc., Prescott, Ont., write to us as follows: "We have your statement before us showing us as a delinquent. This is your own fault, for we would remit whenever bill is rendered. We prize the LUMBERMAN very highly and think no progressive lumberman should be without it. Enclosed please find money order for three dollars to cover your bill rendered."

Going After the Paper Trust.

Speaker Canon of the United States House of Representatives, has introduced resolutions directing the Attorney-General and the Secretary of Commerce and Labor to inform the House what steps have been taken by these departments to investigate the action of the International Paper Company of New York and other corporations supposed to be engaged in an effort to create a monopoly in print paper, and what steps have been taken to prosecute the said corporation, or corporations, for violation of the law, in case reasons for such prosecutions may have appeared from investigation, information from the Department of Commerce and Labor or otherwise.

In a statement Mr. Canon said if the claims of the publishers are correct the manufacturers of paper are subject to penalty and the "trust" can be dissolved in the United States courts.

"The duty on print paper," said he, "is fifteen per cent., ad valorem, and has been the same since 1890, under the McKinley law, the Wilson law and the Dingley law, covering a period of eighteen years. It is claimed that the price has been advanced within the last few months largely more than equal to the duty. The publishers of the United States, represented by Mr. Herman Ridder, claim that the manufacturers of wood pulp and print paper have by agreement and combination, even covering arrangements with Canadian manufacturers, arbitrarily limited the production and advanced the price of print paper. If the claim of the publishers is correct, the manufacturers of print papers are subject to penalty and the trust can be dissolved and enjoined by proceedings in equity in any of the United States courts."

Representative Sulzer of New York is also out on the same war path. He has introduced a bill to place wood pulp and printing paper on the free list. He said he proposed to make an individual filibustering raid against all Republican legislation until the Republican leaders should declare their willingness to pass such a measure.

Describing the paper "trust" as one of the "hydra-headed monsters which have been tightening their hold upon the people," Mr. Watkins (Louisiana) made a plea for the immediate removal of the duty on wood pulp with a corresponding reduction on paper made from wood pulp. The newspaper, he argued, was one of the main civilizing agencies of the world, and in this country "sheds light in fifteen million homes." While to-day the newspaper industry was working in harmony with organized labor, its operating expenses were higher because union labor was more expensive than unorganized labor a few years ago. There was a tariff on everything that went to make a newspaper. "This," he said, "is purely and simply a donation to the paper trust and a tax on the newspapers and other printing interests of the country."

Conservative Lumbering Methods.

Conservative Lumbering and Forestry Methods in Eastern Canada, was the subject of a paper by Mr. R. R. Bradley of Boiestown, N. B., read before the recent forestry convention at Montreal. He gave special attention to the pulpwood industry, pointing out the advantage to be gained by a systematic treatment, and explained the methods applied by the International Paper Company. This company are taking active steps to develop a policy which will insure a perpetual rotation of wood crops over their holdings. The intensive cultivation to which European forests are subjected cannot be applied to present conditions in Canada; but there are some measures which may be adopted and will accomplish the principal aims of scientific forestry at very little additional cost over present logging methods. The pulpwood industry in particular is peculiarly adapted to the application of conservative methods of lumbering. The reason is two-fold. In the first place very low grade material has a value in the pulpmill and secondly the immense cost of pulp and paper plants requires a regular annual supply of pulpwood over a long term of years, in order to make the original investment pay.

Speaking of the annual cut, Mr. Bradley says, a company that undertakes to handle its timber lands conservatively, must at once settle what amount of material can be removed annually, without detriment to the capital stock, as it may be called, of the forests. The annual cut should approximate closely to the annual increment of growth. To

obtain exact figures on this is impossible without a vast initial expense. The Mirimichi Lumber Company, with which Mr. Bradley has had a long connection, made a careful though rapid cruising over its whole tract in New Brunswick. The men in charge were old woodsmen. They overhauled the history of each block as far as possible and made a rough estimate of what might be removed annually over a long term of years. Since then the plan has been, during the summer months, to block out into square miles, those localities which are to be worked within the next few years. A careful cruise is then made to determine the best treatment for each locality. The cruiser estimates as closely as possible the total amount ready for the axe, and the amount that can be profitably removed each year. The size and number of the camps to be sent in each fall, are based upon the cruisers' reports. From year to year more complete information can be obtained and the cut advisable determined more accurately. Trained cruisers are very difficult to obtain at present and therefore scientific foresters should be employed and also a thorough woodsman who should be in charge of the cruising and cutting. More men if wanted should be promoted from among the woodsmen or taken from the forestry schools.

Referring to economy in logging methods Mr. Bradley recommended the substitution of saws and axes, in log making, the cutting of ties no higher than the swelling of the root, taking trees as far into the tops as possible, removing all dry standing trees and dead and down timber if partially sound, and all lodged trees or merchantable culls. After a fire, all burnt material of any value should be removed before thrown by the wind, or attacked by insects and fungi. To insure future crops the system in most common use was that of cutting down to a minimum diameter limit. This was both cheap and practicable. The Mirimichi Company used a general diameter limit of fourteen inches, breast high. But there were many exceptions to this rule, controlled by local conditions.

No company need expect to introduce a fully developed system of conservative lumbering into its woods all at once. Woodsmen could be brought to change their methods only by slow and patient work. They must not be overcrowded with too many ideas at the start. Men who had chased up the cheapest logs available all their lives, failed to appreciate the value of what was formerly counted waste material. They were in the habit also of discounting the future and paid little heed to regulations that looked to future returns. Systematic educative work should be carried on. A short series of lectures might be delivered through the country with excellent results.

A general diameter limit in spruce woods would never prove satisfactory and might result in greater loss on one side than saving on the other. These questions could only be settled by thorough and skilful investigation on the ground. Regulations could hardly be set down on paper, clearly enough to cover all cases, yet the cost of supplying enough experts to fix the proper diameter limit for each locality would be very great. The only solution to be found at present was a partial one, viz.: co-operation between the government and the lumbermen. The government might introduce a clause encouraging those companies which show a clear intention of cutting conservatively, and which employ trained men to handle each section. A few trained men in the government's service could exercise a general surveillance over the work of the different companies which would avail themselves of it. Where it was clear that a company was taking advantage of the government and stripping the berth clean, its privileges could be cancelled, penalties imposed, or the licenses confiscated.

Mr. Bradley dealt with the questions of fire protection, planting, and the establishment of forest reserves, and said in conclusion that the system he had outlined, though far from approaching any European ideal, was bringing results, at practically no increased cost to the lumberman. A great deal of material which had been formerly wasted was now being utilized, while a substantial annual supply was practically assured, as long as fire was avoided. It might safely be said that the holdings of the Mirimichi Lumber Company had increased in value from fifty to one hundred per cent. since they began the application of practical forestry to their woods work. The pulpwood industry offered the greatest inducement to the practice of forestry and afforded the greatest opportunity for its future development.

THE WOODWORKER

A Modern Wood Column Plant.

BATT COLUMNS GROUPED IN CLUSTERS

An interesting and well-equipped woodworking establishment is that of Batts, Limited, of the City of West Toronto (until recently known as Toronto Junction). The Batt factory is worthy of more than passing mention, owing to the success that has been made by the management in their own special line, viz., the manufacture of staved columns. It is about seven years since the present business was launched, and it has made very gratifying progress.

The buildings occupied, on Pacific avenue, West Toronto, are well suited for the purposes of the company, and the facilities for manufacturing are of the best. Not a little of the firm's success is due to the fact that the Messrs. Batt are born mechanics, and are particularly adept at adjusting and improving machinery for their own purposes. This has enabled them to perfect several special contrivances for the

improvement of their goods and the lowering of the cost of manufacture.

"Our making a specialty of columns," said a member of the firm to THE CANADA LUMBERMAN, "was the result of close study of ways and means for producing superior goods at the minimum of cost." The firm state that, owing to their facilities and organization being devoted to their specialty, they are able to manufacture at considerably less cost and this has had a marked effect on the importations of staved columns.

It is of the merits of their product that the firm are specially proud. They state that, by using a greater number of staves than is usual, and each stave being manufactured in the proper shape, their columns have a more even thickness than ordinary makes. They have the same entasis before being turned as after. The stock columns shown at the factory have a most pleasing and attractive appearance, owing to being built to correct proportions. The equipment of the plant is such that they manufacture columns in stock sizes or to architects' details, either

INTERIOR VIEW SHOWING BATT COLUMNS

for exterior or interior use and of whatever diameter and length required. Interior columns are manufactured from any of the cabinet woods, and the samples shown are exceedingly artistic. An important feature adopted by Batts, Limited, is the "V" locked joint, which prevents the staves from opening and also gives a larger gluing surface. Another feature, and one which the firm believe is original with themselves, is the method of connecting cap and base to their stock columns. This is shown in one of the illustrations in connection with this article. In the cap there is a groove which fits over the top of the shaft, while the centre of the base is raised permitting the shaft to fit around the raised part. Both ends of the shaft are bedded in mastic putty. This plan makes it impossible for water to get into the interior of the column and adds greatly to the life of the columns by preventing warping, cracking or rot, so often caused by water getting inside the columns.

BATT COLUMN SHOWING METHOD OF CONNECTING CAP AND BASE TO SHAFT

The Life of a Pork Barrel.

A pork barrel in use for 225 years has been discovered in Torrington, Conn. The relic that has been the burial place of succeeding generations of Connecticut hogs, belongs to Uri Whiting, to whom it was presented recently by Lucian Burr. It has been a part of the Burr family furniture for over eighty years. According to the record that goes with the barrel it was 100 years old in 1743. Since then it has been in constant use, and has been handed down through the family by succeeding generations. The barrel is not only well preserved, but it is said to have acquired a delicious flavor.

Cooperage Stocks Are Very Light.

Cooperage affairs are summed up by the Sutherland-Innes Company, of Chatham, Ont., as follows: The mills are now through stocking for the winter, as the weather is broken and the woods are impassable, so that it is a good time now to size up the situation as to stocks on hand.

As far as Canada is concerned the stocks at most of the mills are very light. Some mills where the sleighing was good have fairly good stocks, but the mills in the northern part of the country were not able to get in very much timber on account of the heavy snow, which was worse than it has been for years, making the roads and woods almost impassable. Taking it all around Canada, the stocks are about equal to what they were a year ago, very few of the mills having in more than one-third stock.

The same conditions apply in the northern part of Michigan, and, in fact, in certain sections all over Michigan, Ohio and Indiana.

From personal inspection and reports received, we consider that the stocks taken out at the mills this year are, if anything, a little heavier than a year ago throughout the whole of the country, but still far too light to supply even an ordinary demand for cooperage stock, and consequently a great deal of summer lumbering will have to be done to supply the trade.

The prices on staves remain firm; hoops are a little easier, while heading is considerably off, the result of a longer winter than usual being that a great deal more heading was taken out than a year ago, as heading bolts can be brought in when it is impossible to haul logs.

Most of the manufacturers have already sold all they care to sell of the higher grades of stock, and at fairly good prices. There is still considerable of the lower grades of stock for sale, the larger manufacturers not caring to sell this class of stock very much ahead, but to hold it until they see how the apple crop is going to turn out.

From present indications we look for prices on higher grades of staves and heading to be maintained; if anything, to go higher. Hoops are likely to remain stationary for some time, as the demand is light at this season of the year, but they are a good buy at present prices. Head-

ing, however, we believe will be cheaper in the mill run and No. 2 grades, as the season progresses, until we are sure of an apple crop, when there will be an upward tendency.

Mr. Booth Eighty-One Years Old.

Mr. J. R. Booth, the veteran lumber and paper manufacturer, celebrated his 81st birthday on Sunday, April 5. He was congratulated by a great number of friends who called upon him. With the exception of a slight injury sustained a few days ago, Mr. Booth is in his usual vigorous health.

On April 2 he was superintending the work on the erection of a new flume at the Chaudiere, when a log fell on one of his legs. At first it was feared that the member was broken, but, fortunately, this was not the case. He, however, sustained a bad sprain of the ankle. The injury will probably confine him to the house for a couple of weeks.

Canadian Piles for Mexico.

A further instance of the development of trade between Canada and Mexico since the inauguration of the Canadian-Mexican Steamship Line, is afforded by the shipment of teredo-proof piles, per steamship "Lonsdale", which left Vancouver about April 1st. This order was placed through the Mexican Consul at Vancouver; the piles being supplied and treated by The Gold Teredo-Proof Pile Company of Vancouver, a concern which has for some years past been treating piles in such a manner as to make them withstand the attack of the teredo. The Gold Teredo-Proof Pile Company has also received a contract from the British Columbia Electric Company of Vancouver, for the renewing of the piling in the Kitsilano bridge, over False Creek.

More or less has been said about mis-matching pieces in furniture making. Much more should be said, for the carelessness shown in some plants is little less than shameful.

1 refitted 24" wood frame surface planer.
1 new 18" "Little Giant", planer and matcher.
1 refitted 16" pony planer complete.
1 nearly new 13" heading planer.
1 13" lightning flooring machine in good order.
1 refitted 12" flooring machine complete.
1 nearly new 24" buzz planer and countershaft.
1 new 16" buzz planers and countershafts.
4 new 12" buzz planers and countershafts.
1 new Cowan post boring machine
1 refitted horizontal boring machines.
2 new Cowan two spindle wood shapers (wood too)
2 new Robinson two spindle wood shapers (iron
top).
2 refitted single spindle wood shapers.
12 new saw arbors (No. 1 to No. 4)
1 new self feed rip saw table complete.
2 new dimension saw tables.
1 nearly new combination roller top saw table.
1 improved rip saw table in good order.
3 nearly new variety saw tables.
2 refitted handle and spoke sawing machines.
1 new No. 2 Crescent saw table with boring attach-
ment.
2 new No. 1 Crescent saw tables.
1 new iron frame swing cut off saw.
2 refitted iron frame swing cut off saws.
1 nearly new hand and foot power saw table.
2 new 36" pedestal band sawing machines.
1 new 20" hand and foot power band sawing
machine.
1 new Crescent panel band sawing machine.
2 refitted 54" band resawing machines.
2 refitted 40" circular resawing machines.
1 refitted 24" single drum sander good order.
1 nearly new 32" disc sander with boring attach-
ment.
1 new Cowan blind, sash and door clamp.
5 new Fox wood trimmers.
1 refitted Cowan spindle carving machine.
50 new Palmers patent glueing clamps No. 3.

FOR SALE

MOST VALUABLE LUMBER AND PULP-
Wood Property in North America—Unex-
celled in the World.

Over Six hundred square miles Spruce Timber;
very accessible; cheap logging; good shipping.

Great Bargain offered prompt buyer.

For detail report and full information address

AMBROSE & BELKNAP,
Amherst, N. S.

MANUFACTURING SITE

EXCELLENT PULP MILL SITE OR ANY mill manufacturing connected with the T. & N. O. Ry. Good water power, naturally developed. Lots of spruce for years to come. Apply Box No. 1, New Liskeard, Ont.

WANTED**Party with small Circular Mill.**

TO CONTRACT FOR AT LEAST FIVE years' sawing near French river—Hardwood, Pine and Hemlock—About two and a half millions per season. Address Box 595, CANADA LUMBERMAN, Toronto.

SAWING CONTRACT

WE ARE OPEN TO CONTRACT FOR CUTTING of lumber by the thousand in any quantity from one million to one hundred million feet.

SOUTH RIVER LUMBER COMPANY, Limited
South River, Ont. 10

B. C. TIMBER AND TIMBER LANDS.

I HAVE FOR SALE, SOME OF THE FINEST tracts of Timber in British Columbia, principally Spruce, Fir and Cedar, ranging from 2,000 to 140,000 acres, mostly on tide water, and easily logged. Prices from \$1.00 to \$9.00 per acre. State your wants: I will supply them. W. H. LEMBEKE, P.O. Box 972, Vancouver, B.C. 9

FOR SALE

LOTS 7, 8 AND 9, TOWNSHIP OF PERRY, about 3 miles west of Emsdale Station, Grand Trunk Ry., containing approximately 400,000 ft. Birch, 150,000 ft. Balsam and Spruce, 200,000 ft. Hemlock, large quantity of Beech and Maple and small amount of Elm and Black Ash; clear title. Good winter road to station, short route, Price, \$3,000. Apply BENJAMIN MABEE, Emsdale, Ont. 8

AUCTION SALE

— OF —

**VALUABLE TIMBER LIMITS,
SAW MILL,**

Plant, Supplies, Mining Lots, Logs, &c.

— OF —

**THE EAST TEMPLETON LUMBER
COMPANY, LIMITED.**

There will be sold by Public Auction, at the Russell House, in the City of Ottawa, on Tuesday, the 15th day of September, A.D. 1908, at 2.30 o'clock, p.m., by THE EAST TEMPLETON LUMBER COMPANY, LIMITED, the following Timber Limits, Real Estates, Saw Mill, Mining Lots, Plants, Supplies and Logs in transit, namely:—

Parcel Number 1. "Coulange Limits," comprising 156 square miles of Timber Limits on the Coulange River in the Province of Quebec, covered by Licenses Numbers 149, 150, 151 and 152 of Season 1873-74 and known as Berths W, X, Y and Z, together with certain Limit Plant, Supplies and Live Stock to be sold therewith.

Parcel Number 2. "Hibou Limit (Gatineau)," comprising 20 square miles of Timber Limit on Hibou and Ignace Creeks covered by part of License No. 550 of Season 1873-74, together with certain Limit Plant and Supplies to be sold therewith.

Parcel Number 3. "Wakefield Limit (Gatineau)," comprising 8 square miles of Timber Limit in the Township of Wakefield covered by License No. 58 of Season 1873-74.

Parcel Number 4. Several Freehold Timber Lots in the Township of Wakefield.

Parcel Number 5. "Black and Dumoine Rivers Limit," comprising 26½ square miles of Timber Limit on the Black and Dumoine Rivers covered by part of Licenses Number 362 and 369 of Season 1873-74 together with certain Limit Plant and Supplies therewith.

Parcel Number 6. Real Estate, Saw Mill, Lumber Yard and Wharf at East Templeton. This parcel consists of about 208 acres more or less of Freehold and 5 acres of Leasehold land at East Templeton, P.Q. (about 8 miles below Ottawa on the Ottawa River), together with a fully equipped Saw Mill and Machinery erected thereon having a capacity of 150,000 feet per day, with Lumber yard, Wharf, Railway siding, Cars and other plant and machinery therewith.

Parcel Number 7. Mining Lots. This parcel consists of several mining lots and mining rights in the Townships of Wakefield, Buckingham, Portland East, Portland West and Derry.

Parcel Number 8. A large quantity of logs, timber, telegraph poles and ties now lying in and about the Ottawa, Coulange and Gatineau Rivers at and in transit to the above mentioned Saw Mill.

The first seven parcels above mentioned will first be offered for sale en bloc, subject to a reserved bid fixed by the Vendors. If the reserved bid is not reached, then each parcel will be immediately offered for sale, separately, subject to a reserved bid fixed by the Vendors.

Full particulars and complete descriptions of the respective parcels and the terms and conditions of sale will be made known at the time of sale and may be seen on application to the Vendors at East Templeton, P.Q., or to their Solicitors, Messrs. Gormully, Orde & Powell, No 33 Sparks Street, Ottawa.

THE EAST TEMPLETON LUMBER COMPANY, LIMITED,
Vendors.

Dated this 3rd day of March, 1908.

An Old-Time Forester.

Dr. B. E. Fernow, Dean of the Faculty of Forestry, University of Toronto, is authority for the statement that in Montreal the first organization for the preservation of the forests of this continent was formed, and that the father of that organization, and of the movement for the conservation of the forest wealth, is alive in Montreal to-day in the person of Mr. William Little. The movement towards forest preservation was occasionally heard of in the late seventies. In 1882 a convention was called to meet in Cincinnati in April, of all interested in the work. Mr. Little, Dr. W. E. Saunders, of London, and another gentleman represented Canada at that convention, which proved to be more political than forestry. So unsatisfactory were the results that Mr. Little proposed a real forestry convention, to be held in Montreal. In August of the same year the American Forestry Association was then formed, and the foundation of the work that is now being done was laid. Mr. Little inherited his interest in forestry, his father having been an active worker in the cause.

**Forestry Exhibition at
Stockholm.**

The Government of Sweden is preparing invitations to the nations of the world to take part in a forestry exhibition at Stockholm in 1910. The invitations will explain the details and full scope of the show, plans for which are now rapidly progressing. Wood products of every sort and in all stages of manufacture are to be exhibited in a large building especially prepared for the purpose. The most expert foresters of various countries will give lectures on the latest phases of the art of preserving, developing and taking care of forests. An important part of the exhibition is expected to come from the Adirondacks and other sections of America; also from the insular dependencies of the United States, where recent work of exploration and analysis indicates that timber is considered to surpass in interest value that of other parts of the country.

Britain will be requested to send exhibits from Egypt, South Africa and India. For the first time it is expected the tree wealth of the far east will be adequately shown. Canada, Australia and New Zealand will all have exhibits.

GORDON HOLLOW BLAST GRATE CO., GREENVILLE, MICH.

Current Trade Conditions

ONTARIO.

Lumber conditions in Ontario show practically no important changes during the last fortnight, but from the point of view of the manufacturer they are somewhat more encouraging. About a month ago business commenced to pick up and showed quite an improvement over the previous three or four months. Since that time the enquiries and sales have been going along at just a steady pace. One large Toronto firm reports that during the last four weeks it has had more enquiries than during the previous four months, and that many of these enquiries have led to sales. Some enquiries are coming from the United States but the English demand is slow. Most of the enquiries today, are for the lower grades and the sales are almost entirely confined to them. In the higher grades there are a few enquiries and practically no sales. The trade generally seems to be in a waiting mood, the enquiries frequently being simple feelers resulting in no sales.

Reports from various parts of the province confirm the early estimate that the cut of logs for the past winter would be reduced about one-third. Until the middle of February the logging season was good, but at that date a bad snow storm blocked up the roads. Most of the cutting had then been over, but the hauling had still to be done. The snow storm put it back about two weeks. The small cut of logs will not be felt this summer by the manufacturers because the mills have carried over from last year sufficient logs to make a normal cut. Last summer was a bad one, and followed a late spring, so that a great many of the logs cut, never reached the mills. These will all come down this summer and make up for the small cut. Lumber manufacturers are maintaining a

stiff upper lip. They have been able to hold off this long and apparently do not propose to give in at so late a stage of the game. They believe that a good demand will soon arise. Building demands will make it necessary for dealers to increase their stock. Stocks throughout the country are said to be very low in the retail yards. Under such conditions the manufacturers are convinced that they need only wait for their time. They are not looking forward however, to more than an ordinarily busy season. Another large firm in Toronto reports good enquiries from England for the higher grades. One of the largest English dealers was in Toronto a few weeks ago looking into the situation.

EASTERN CANADA.

Reports from St. John, N. B., indicate that the starting of the mills this season will be later than for many years. The outlook is less favorable than usual, on account of a combination of circumstances. Deal markets have been dull both in Great Britain and the United States. The scarcity of spruce logs moreover, will delay the opening of the mills. Some of the biggest manufacturers will be unable to commence sawing until the first of the new logs reach their booms. This it is expected will not be until the last of May. The usual time to commence sawing is about the first or middle of March and the season therefore is already several weeks behind time. As to the time for starting this year, much will depend upon the ability of the manufacturers and employees to make an amicable settlement of the question of wages. It is generally expected at present that this will be a matter of much difficulty.

WESTERN CANADA.

A general awakening is expected almost at once. Demand from the prairies is increasing and retailers

there are reported to have lowered prices, as they have got rid of most of the stocks bought at a high figure. They can now buy at the reduced figures made by western manufacturers. The building trade is exceptionally lively and promise a good demand for lumber. The decision of the government of British Columbia to permit the export of low grade logs in the water, threatened by the teredos, will prove a great boon and enable owners to put a lot of money in circulation. There is a good demand for these logs in the United States ports. The result will be a removal of financial tightness for the owners of these logs and the whole trade is expected to feel the benefit.

UNITED STATES.

Reports from east and west indicate a change in the lumber trade. During the last fortnight or three weeks an improvement has been especially noticeable. Chicago reports indicate that by May 1st demand and distribution will probably have reached such proportions as to restore fair activity—in fact a normal business for the time of year. Lower prices are being made by the retail trade as a result of lower prices offered by the wholesalers. Enquiries are numerous for fir, cedar, spruce, larch and other western coast woods. Chicago wholesalers report a possible increase of demand for western goods. Producers feel generally, that prices have reached rock bottom. Crop prospects in the winter wheat regions are good, and are having a strengthening effect on the lumber markets. It is not expected that there will be any lack of pine lumber as the result of the short log crop, before late in the season at any rate. Trade at all lake points shows signs of improvement and the northern pine trade is moving easily and steadily into its season of normal activity. Hemlock is still suffering from the competition of southern pines, but is improving in Buffalo, Pittsburg and Western New York and Pennsylvania, on account of increased activity in building. Boston reports

are quiet, with a little more encouragement for the future. Price cutting continues. Spruce has not been as well held of late. North Tonawanda reports quiet trade but threadbare stock in many places. Next to no lumber is going in from Canada. Buffalo white pine dealers complain of the competition of yellow pine but believe an improvement will soon come. New York reports just an average demand with a slight tendency on the part of the retailers to stiffen prices particularly for spruce and hemlock.

GREAT BRITAIN.

There is a slight tendency towards improvement in the lumber trade. Things are not quite so lifeless as they have been for some months past, but the improvement is only of the very slightest. Some Manchester firms even refuse to recognize that there has been any improvement. Other reports state that actual business is increasing, and that enquiries show a great improvement on the sluggish state of things which has been prevailing of late. Most of the stocks sold have been of the commoner sorts, and in many instances further concessions in prices have been made.

Just a little more life is discernable in spruce. A cargo or two is offering, shippers anticipating about £8 c.i.f. for the usual 50-60 per cent. of narrows. The ball must start rolling shortly. Stocks are being depleted, and even on a hand-to-mouth policy must be replaced. The position is too uncertain to say much about it. Quebec spruce is beginning to move. Some fair lines have been placed at prices similar to last year's opening values.

London sales have been very small, but this need not be looked upon as an altogether bad sign. There are many firms in England that have not bought a stick of wood this season. Apparently they are playing a waiting game, and it would not be surprising if it should result in more harm to them than good. There is very good reason to expect a more cheerful tone a little later on, both in regard to prices and demand.

We make a specialty of Tank Stock and Silo Material, any thickness, width or length.

A Valuable Lesson for Canadians.

At the annual convention of the Canadian Forestry Association in Montreal, last month, Mr. Wm. Little, former honorary secretary of the association, read a paper entitled, "A Timber Famine in Sight". After referring to the general alarm felt upon the subject, he said, that an official and conservative estimate of the present consumption of wood in all forms in the United States was at least one hundred billion feet a year, and the most detailed estimate of standing timber ranged from fourteen hundred to two thousand billion feet. If these estimates were correct, it would indicate a supply for from fourteen to twenty years at the present rate of consumption, which was of itself sufficiently alarming, even if a mean between these numbers, say seventeen years, were accepted. But when taking into consideration the fact that only one-third of this stock was east of the Rockies—where there was nine-tenths of the consumption—their eastern timber represented barely a six years' supply, and over three-fourths of this was in the Southern States. Of course, the annual growth had to be taken into account, which would prolong the time of exhaustion to some extent, but against this must be placed the loss by fire, tempest and other destructive agencies, so that it might be said that in the United States, east of the Rockies, a timber famine was already in sight. Indeed, a timber famine was in sight in nearly all the northern and north-eastern states, from Maine to the Rocky Mountains, and but for lumber supplies obtained from the southern states (from which section more than one-third of their entire lumber cut was now derived) this vast territory would be forced to look even now to Newfoundland and the north of Europe for timber to supplement its scanty stock since Canada needed all her timber for her own development.

After detailing the events leading to the exhaustion of the United States white pine resources, Mr. Little pointed the moral for Canada. We should give the whole question the utmost attention possible if we were to benefit from the lessons afforded. In conclusion he said it was lamentable in view of the events of the past to see that while Americans were now securing vast areas of our best timber territory at less than a tithe of its true value, Canadians were supinely looking on without uttering a word of protest against the sacrifice.

Death of Thomas Meaney.

The death occurred in Montreal last week of Thomas Meaney, the well-known lumberman of Toronto, head of the firm of Meaney & Company, wholesale lumber merchants, with offices at 103 Bay street. Death was due to pneumonia. Two weeks previously, when Mr. Meaney left the city, he was in very good health, and no word had been received that he was ill.

Mr. Meaney had been in the lumber business for years, and organized the present firm. He started business for himself, and subsequently J. M. Thomson became a member, and later J. R. McDonald joined the firm, which is now known as Meaney & Company. For some years past Mr. Meaney has been superintending the branch of the work in Montreal and Quebec, which included a large pulp mill, and when he left home a few weeks ago it was to attend to this work. He leaves a widow and one daughter, who live at 114 Denison avenue, Toronto.

The Late Henry L. Tibbetts.

The death is reported of Mr. Henry L. Tibbetts, of Lowell, Mass., of the Skillings, Whitney & Barnes Lumber Company, New York. Mr. Tibbetts was treasurer and general manager of the company; vice-president and director of the Cavendish Lumber Company, Lakefield, Ont.; vice-president and director of the Campbell-McLaurin Lumber Company, Montreal; director of the Temagami Lumber Company, Callander, Ont.; vice-president and director of the Central Savings Bank, Lowell, Mass., and director of the Appleton Company, Lowell, Mass. Mr. Thomas F. Strong, of Ogdensburg, N.Y., has been elected general manager of the company, and Mr. Jamse D. McLaurin, of New York, treasurer to succeed the late Mr. Henry L. Tibbetts. Mr. Henry J. Bartlett, of Orillia, Ont., has been elected to the Board of Directors, and will occupy the position in Canada of resident managing director.

A New Ontario Lumber Company.

The Gouliais River, Land & Lumber Company, Limited, recently organized, will conduct a lumbering and saw mill business on the Gouliais river. The officers and directors are: President, Thomas Kirby, Sault Ste. Marie, Ont.; vice-president, Earl H. Edwards, Petoskey, Mich.; general manager, Norval W. Kirby, Sault Ste. Marie, Ont.; secretary and treasurer, Fred. E. Baldwin, Petoskey, Mich.; Arron W. Loveys, Sault Ste. Marie, Ont., and Willard I. Thayer, Sault Ste. Marie, Ont. The authorized capital is \$40,000, and the shares are of \$100 each, non-assessable and fully paid-up.

The company own and control 3,000 acres of valuable timber lands in the fertile Gouliais river valley, which contain over 25,000,000 feet of mixed timber, black birch, hard maple, white pine, hemlock, spruce, balsam, and cedar. There is a saw mill on the property with a capacity of 25,000 feet per day, and a shingle mill with a daily output of 40,000 shingles. The property is located in the mineral belt on the north shore of Lake Superior, in the township of Vankoughnet, between the Hillman and Root river silver and copper mines and the Superior and Eagle galena and copper mines. It is three miles from Bellview station on the Algoma Central and Hudson Bay Railway.

No Scarcity of Canadian Poles.

Mr. E. A. Lindsley, secretary and treasurer of the Lindsley Bros. Company of Spokane, Wash., says that there are more electric lighting poles in British Columbia than ever before, and that the dealers would be glad to sell them if there was any demand. His company is interested in the pole business in British Columbia, having on hand about 40,000 poles, but there is no immediate prospect of sales. The pole market in that section is overproduced, it seems, as other companies than Mr. Lindsley's report the same condition.

Barbados Lumber Trade.

Messrs. S. P. Musson, Son & Company, Barbados, report under date of March 14, regarding lumber stuffs: There have been no arrivals during the fortnight. White Pine—The deck load of the "Elise," consisting of 15 m. ft., was sold at \$14.17 round, and the inboard cargo, 125 m. ft., chiefly second quality, at \$19.60 for second quality, \$14.10 for inferior. The market is still fairly well stocked with this class of lumber. Spruce and Hemlock—21 m. ft. spruce ex "Elise," the remainder of the deck load was sold at \$14.17 round, and 25 m. ft., all seconds and inferior, at \$12.10, while 85 m. ft. hemlock, the balance of the cargo, fetched \$16.25 for merchantable, and \$12.25 for second quality. The market keeps well supplied, and we do not look for any improvement in prices just yet. Pitch Pine—No arrivals. Shingles—There have been no arrivals, and demand for both Gaspe and cedar laying is good, especially the latter. Shooks—No receipts. Wood Hoops—Receipts consist of 500 bundlers by the "Conway," which have been stored.

The Waterous Engine Company report that the Big Bend Lumber Company, at Arrowhead, B.C., the Bowman Lumber, at Comaplix, B.C., and the Revelstoke Saw Mills Company, at Revelstoke, B.C., are adopting the new Waterous improved band saw guide.

The A. R. Williams Machinery Company, Limited, of Vancouver, report the following among their sales for the past month: A large drag saw machine, to the Alberta Lumber Company, Vancouver; a 60 inch double planing mill exhaust fan, to the Columbia River Lumber Company, of Golden, B.C.; a 12 x 16 right hand Atlas engine and a double surfacer, planer and matcher, to the Chilliwack Manufacturing Company, Chilliwack; a "Simplex" shingle machine, to Messrs. Pelletier & Lund, of Vancouver; one combination saw and dado machine, to Shawinigan Lake Lumber Company, Victoria; an improved carriage cut-off saw machine, to Hammond & Son, Vancouver; a 26 x 10 inch double cylinder surfacer, to the Pacific Box Company, Vancouver; a three saw edger, to W. J. Malcolm, of New Westminster; a 16 x 22 inch Atlas heavy duty engine, to the North Arm Lumber Company, Eburne, and a 24 x 12 inch planer and matcher to the Laurie-Forester Lumber Company, Creston, B.C.

LUMBERMEN

YOU will soon be requiring supplies for the camp and we desire to let you know that we can handle the grocery and provision part of this business for you in a thoroughly satisfactory manner. THE NEWS

The British barge "Inverneil" has just left British Columbia ports for Calais, France, with 1,244,200 feet of lumber.

The Joseph Chew Lumber & Shingle Company, Limited, of Vancouver, started up their mill on April 1st.

The Imperial Shingle Company of Vancouver, resumed cutting about April 1st turning out their full capacity of shingles.

The Houser-Armstrong Lumber Company, Limited, Willow Range, Man., have disposed of their business to J. H. Stewart.

John A. McRae, lumber manufacturer, Inwood, B.C., has been succeeded by the Inwood Coal & Lumber Company, Limited.

The Vancouver Lumber Company are building an addition to one end of their mill, to allow for the installation of a new Mershom Saginaw Band Re-saw.

At a meeting of the board of directors of the Louison Lumber Company, Limited, Sayabec, P.Q., held recently, it was decided to remove the head office to Jacquet River, N.B.

It is figured that about 70 million feet of logs will be rafted by the St. John River Log Driving Company in New Brunswick this season, about 65 million from above Grand Falls and about six million from the Tobique.

The Quebec Department of Lands and Forests now has an annual revenue of well over a million dollars, the major part of which comes from the forests. There have been no sales of timber lands since June, 1906.

The W. W. Stuart Lumber Company of Vancouver report that they have been running steadily at full capacity all winter, their output being used chiefly for local trade. They have recently put up a new moulding shed and office buildings.

A Trinidad report from Gordon Grant says, no fresh arrivals have taken place of lumber or cooperage materials, although several cargoes are on the way. The position generally is unchanged and the market is kept well stocked with all grades of lumber.

After a more or less general close-down of nearly five months, the majority of April, in order to stock up ready for future business. The mills in general are looking for an early resumption of the lumber activity of the Northwest, with the opening of spring.

The office of the Oregon and Washington Lumber Inspection Bureau has been removed from the Canterbury Block, Washington, to rooms 418, 419 and 420 Commercial Club Building, corner of Fifth and Oak streets, in conjunction with the Lumber Association.

Most of the lumbermen in New Brunswick have stopped operations for the season and taken out their crews. The year has been a fairly good one in this industry. At Mahone Bay about 2,000,000 feet represents the cut. This lumber will be sawed near the town and shipped from the port.

On Tuesday, March 6, last, the death occurred of Mr. Walter Tench, the well known manufacturer and dealer in lumber, shingles, sash, etc., Waterford, Ont. The funeral took place to Greenwood cemetery on Friday, March 6. The business will be carried on under the name of the Walter Tench Estate, until further notice.

Another sash and door factory is being started at Vancouver by William Viles and Frank Caddy, who are establishing a factory on Carnarvon street. They will also engage in the jobbing and contracting business. The factory will be replete with the most modern machinery, arrangements having already been made for the purchase of two band saws, planer, sand papering machine and the usual plant necessary for a well equipped business.

Further returns presented to the House of Commons, Ottawa, with reference to the disposition of timber limits, show that J. W. Stewart, of the contracting firm of Foley Bros., Larsen & Stewart, has secured seven berths, covering an area of 330 miles of valuable territory between Peace River and Lesser Slave Lake. Mr. Stewart was the only bidder in each case, the bonuses ranging from \$500 to \$1,500, or a total of \$7,000 in all.

A. Knechtel, for seven years inspector of forest reserves in New York State, has gone gone west in pursuance of his new duties with the Dominion Government, having been appointed inspector of forest reserves. His headquarters during the summer will be on the Riding Mountain reserve, B.C., but he will visit all the other western reserves, twenty in number. Pine, spruce, tamarac and white larch will be experimented with in his afforestation work.

S. Baxter, Provincial Inspector of Boilers, Vancouver, who recently returned from a trip on Vancouver Island, states that activities there will probably be resumed soon. Hooper Bros., of Duncan, are taking out 20,000 ties in fulfilment of a contract with the C. P. R. The Westholme Lumber Company, which has not been in operation for a few months, has started again on an extensive scale. The Quamichan Lumber Company has followed suit.

The United States Forest Service at Washington has established a laboratory for investigating the structure of commercially important woods, so that architects, builders, dealers and users may be furnished means of determining just what a wood is and to what use it is best adapted. The necessity of something of this kind is being more and more felt by the trade because of new woods being introduced to take the places of older ones which are rapidly growing scarcer.

Albert Cotton commenced operations in his new shingle mill on the south side of False Creek, Vancouver, on March 16th. Mr. Cotton's old mill on the north side of False Creek, was destroyed by fire, on July 13th last. The new mill has a much larger capacity than the old plant; seven shingle mills being in place, giving a total capacity of about 175,000 shingles per ten hours. At the time of writing, a new spur line is being put into the mill which will enable Mr. Cotton to ship by any railroad.

British Columbia timber lessees are much interested in an order just issued from Ottawa that forthwith lessees of Dominion lands must start logging off each leasehold and must build and operate saw mills. The question was recently discussed by the British Columbia Lumber and Shingle Association. The timber lands in the railway belt of the Lower Fraser are particularly affected. It is pointed out by lumbermen that in the great majority of cases these leaseholds are held by men who have never expected an order for immediate and continuous logging, and they are not financially in a position to comply with it. The result would be that they would lose their holdings. The Federal Government have intimated that they might reconsider the order that the mills should be built to cut the timber taken off Dominion lands and permit the lessees to sell to mills already built.

William Kennedy and J. B. McRae, hydraulic engineers, Ottawa, who have returned from an inspection of river works at Grand Rapids and Minneapolis, have informed lumbermen owning power at the Chaudiere that the United States Government spends money on dams and other structures similar to those needed in the Ottawa river. They have an exhaustive report on the water power control in the western cities, but it can not be acted upon until the Canadian Government guarantees that four dams will be built farther up the Ottawa river. It is believed that Hon. Charles Hyman, former Minister of Public Works, was willing to grant the lumbermen's request, and we are now looking to Hon. William Pugsley, his successor, to take action in the matter at an early date so that the Chaudiere dam can be built next summer. The Government is asked to spend \$160,000.

The following report on the lumber trade of Ontario province has been made by Consul E. A. Wakefield of Orillia. The most recent estimates of the pine cut in Ontario received by the departments of lands, forests and mines gives a total of 675,000,000 feet for the past year. Earlier in the season the estimates totaled 710,000,000 feet, showing a reduction in the later estimates of 35,000 feet, or about 5 per cent. Information this consulate has received from various lumbermen is to the effect that not more than four-fifths of last year's cut of logs will be taken out. As many of the operators did not succeed in getting last year's logs to the sawmills, the lumber cut this year should be equal to last season's. There is at present little demand for lumber, but as the stocks are in strong hands prices have not been lowered. Recently signs of improvement in the lumber market have been apparent. The original estimate of railway ties to be cut was 2,500,000. As the Canadian Northern, Grand Trunk Pacific, and Canadian Pacific railways are all obtaining ties in Ontario, the cut will probably exceed 5,000,000 ties. The pulpwood cut is placed at 216,000 cords.

It is reported that an American syndicate, composed of forty-two capitalists, have concluded perhaps the largest single land transaction made in the Province of British Columbia. The syndicate, which is to be known as the Moresby Island Lumber Company, closed their option on 49 square miles of timber limits in the centre of Graham Island, and also of 40 square miles on Moresby Island. They also purchased outright 8,000 acres of the choicest crown grant lands in Graham Island. The investment reaches several million dollars, the initial payment being \$25,000. As a result a sawmill, to cost \$400,000, will be at once erected by the company and located on Cumsheewa Inlet on Graham Island. Various members of the party also hold options on 10 square miles of semianthracite coal lands on Graham Island, but it is reported that coal experts advise against the purchase, declaring that the coal is limited in quantity and unworkable, owing to the broken formation and lack of thickness in the veins. The northern part of Graham Island is already in possession of another American syndicate, known as the B. F. Graham Lumber Company, which embraces both timber and coal lands.

A St. John, N.B., despatch reports that the starting of the mills this season promises to be later than for many years. John E. Moore's mill at Pleasant Point will be late starting, owing to a lack of spruce logs and the plant will not begin operations before mid-May at the earliest. Chas. Miller's mill at Pokiok, and Miller Bros.' mill at Strait Shore, are similarly situated in regard to raw material and will no doubt be equally late in starting. Hilyard Bros. have made no repairs as yet and will probably not begin sawing before May 1st. J. R. Warner & Company have as yet made no preparations to start their plant, and there is no indication that they will begin before the latter date. It is probable that Stetson, Cutler & Company's mill at Indiantown will be ready to begin sawing about April 20. Stetson, Cutler & Company's mill at Pleasant Point is ready to begin sawing at once, but it is probable that nothing will be done for a week or two, owing to the failure of the men and the company to come to terms. Early in 1907 the men demanded an increase in wages, which amounted practically to ten per cent. Under the new schedule shingle sawyers received \$2.20 per day, lath and deal pilers the same sum, shingle bunchers \$1.87, and the other employees in proportion. The rate of wages paid in former years was 10 per cent. less. This year it was decided by the manufacturers that the conditions of trade would not permit the paying of the increased scale. The men at Cushing's mill have been working at the reduced rate for some weeks. At Stetson, Cutler's Pleasant Point mill there was no difficulty so far as the men in the spruce end were concerned, but the shingle sawyers and bunchers refused to accept the low rate and the mill was shut down. Local manufacturers say that they will let their plants stand idle rather than pay the high rate.

Trade Enquiries.

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of THE CANADA LUMBERMAN AND WOODWORKER may obtain the names of enquirers by writing us. State number of enquiry.

305. Broom Handles—Liverpool firm asks prices and dimensions of broom handles from Canadian manufacturers.

312. Pulleys—Manchester firm wishes to correspond with Canadian manufacturers of wood split pulleys.

316. Wood Naptha—Lancashire firm asks samples and prices of wood naptha from Canadian exporters.

318. Lathes—Lancashire firm asks prices of plasterer's laths, sawn and split, sizes 1 1-8 in. x 3-16 in., from Canadian manufacturers.

322. Handles—Liverpool firm invites correspondence from Canadian manufacturers of pick and hammer handles.

323. Pine Doors—Liverpool firm asks prices and dimensions of pine doors from Canadian manufacturers.

325. Handles—Liverpool firm asks prices of pick and hammer handles from Canadian manufacturers.

347. Spruce and Fir—Birmingham firm wishes to get into touch with large shippers of spruce and fir with a view to appointment as agent.

348. Lumber—Birmingham firm wishes to take up agency for lumber.

370. Maple Block Flooring, etc.—Lancashire firm wants names of Canadian exporters. They are also interested in mangle rollers and other timber goods.

371. Office Furnice, etc.—Manchester firm of cabinet makers wants to communicate with Canadian manufacturers of roll top desks and general office furniture. They are also in a position to trade in turned wood (chair legs, dowels, mouldings, etc.).

381. Oak—Rotterdam, Holland, firm wants to hear from Canadian shippers of oak.

382. Wrapping Paper—Cape Town firm of wholesale general merchants want to correspond with Canadian manufacturers of wrapping paper.

389. Veneer Stock—A requisition for veneer stock, which is now supplied by a United States firm. It is for 3 ply, mostly used by picture frame makers in large quantities, mostly ash, because of grain in this timber. They also use plain and quartered oak and a small quantity of fancy woods. Panels range from 22 inch x 26 inch to 60 inches x 30 inches. The bulk would be in the smaller size. The thickness is 3-16 inch or 1-4 inch, principally the former.

390. Agent—French manufacturer wishes to get in touch with agent to sell liquid product for painting outside of wooden houses.

412. Coiled Wood Hoops—Firm of import and distributing merchants in North of England desire to get into communication with Canadian exporters of coiled wood hoops, which should measure from four up to fifteen feet.

416. Oak Planks—Timber firm in north of England wants to receive lowest prices from Canadian manufacturers of wagon oak planks and cabinet oak planks; two inches thick and upwards.

420. Timber Goods—London firm of general merchants and importers desires to get in touch with Canadian exporters of timber goods (flooring, wood excelsior, wood handles, wood mantels, door sashes, turned wood, etc.).

424. Lumber—Belgian firm desires to get in touch with Canadian lumber firms able to supply pit props of fir wood, fully stripped of bark (length 1 metre 60, 1 metre 80, 2 metres, 2 metres 20, 2 metres 50, 3 metres. Circumference at the small end, 35 to 54 centimeters). They wish quotations c.i.f. Calais or Dunkirk, or the Belgian ports.

436. Lumber—Rhodesian timber merchant desires to correspond with Canadian exporters of lumber. Catalogues and price lists required.

D. B. Dulmage, lumber manufacturer of Cranbrook, B.C., says that the lumber business in the interior has not suffered to the same extent as on the coast. The taking out of ties for railways has helped largely. About 750,000 ties are to be taken out this year and Mr. Dulmage has a contract for 150,000 of these, with many contracts in prospect when this undertaking is fulfilled.

Ireland Starting to Reforest.

The people of Ireland pay \$5,000,000 a year for timber, which is imported from other countries. Ireland has only one and one-half per cent. of its land in timber, although 23 per cent. of the land is not adapted to agriculture. Few inhabited countries have been so extensively deforested. The work of changing conditions for the better has been entered upon, however, and scientific forestry will be applied.

Progress has been made in looking to the preservation of the few remaining forests and the reforestation of the vast areas. A popular objection to reforestation in Ireland has been that forest plantations offer less employment to labor than equal areas of agricultural land. It has been shown, however, that a certain forest planted on poor soil not valuable for agriculture, has employed four times as much labor as had been employed on agricultural land and was more profitable to the owner.

"QUALITY IS THE BEST POLICY"

"Goods Well Bought are Half Sold"

WE do not know the origin of this quotation, the truth of it, however, is thoroughly realized and universally accepted by retailers of all lines of goods.

"WELL BOUGHT" can be given a variety of meanings but the only true definition is—the best value for the least money. Some people believe "well bought" synonymous with "cheapest price" without regard to the value received. This is poor judgment and a disastrous business policy to pursue. The success of our "Quality" policy has proved to our entire satisfaction that the lumber trade of today are fully alive to the benefits derived from handling the very best.

We have by far the best facilities for manufacturing, drying and dressing Spruce, found in Canada. It takes time, money and infinite care to keep our standards at all times up to the required mark, but it pays in the satisfaction of our customers and ourselves.

Our Springfield, Mass., sales office will take pleasure in quoting on your requirements for Flooring, Ceiling, Partition, Novelty Siding, New Brunswick Cedar Shingles, Lath, etc.

**"Top-Saw"**

The accompanying cut repre-
sents our regular saw bench, light
or heavy pattern, equipped with
"Top Saw," which can be adapted
to our ordinary carriages.

This Top Saw is especially
made to cut large logs.

The frame of Top Saw is of
solid cast iron. The Top Saw
arbor slides from top to bottom,
by means of screws, visible on
cut, which allows using saws of
different sizes. This Top Saw
is equipped with a thightner,
handy to the operator, to set in
motion or stop the saw, at will.

Iron Frame "Simplex" Shingle Machine

IN this, our latest design of Shingle Machine, we have incorporated all the advantages contained in our wood frame "Simplex" and added several improvements.

The arbor has been made heavier and a third bearing added to support it outside the driving pulley. The method of putting lead in the saw arbor has been greatly improved. This is now done by swinging on a centre directly under the saw the whole frame which carries the arbor. Thus the alignment of the bearings is not in any way affected and there will be no danger of hot bearings after the lead has been changed. The change may be made while the machine is running and without stopping the carriage.

An improvement has also been made in the method of driving the edger. It is belted direct from a shaft running at right angles to the main arbor from which it is driven by means of a bevel friction. This makes a very neat compact drive and has proved satisfactory in the mill.

The rail on which the carriage travels is made of square steel and when worn can be renewed by simply turning upside down.

Over three hundred of our Upright Machines (wood and iron frames) are in use in British Columbia and Washington.

Lath Mill and Picket Machinery

OF DIFFERENT SIZES AND CAPACITIES

Four Saw Bolter and Five Saw Lath Mill have cut in ten hours 84,100 Laths, four ft. long, $1\frac{1}{2}$ " wide and $\frac{3}{8}$ " thick, counted, tied and piled. The machines were capable of cutting still more, but this was all that an ordinary lath mill crew could stand for ten hours steady.

Fig. 1.

New Patent Mill Dog

We claim many points of superiority for our Patent Mill Dog, of which One Hundred and Twenty-Five have been sold.

Each mill dog contains ten dogs; six of the dogs have the down-forward motion and four of them the upward motion, so that the log or cant is dogged both on the top and bottom, preventing it from turning its position on the head-block. Even if the log were dogged, not touching the head-block, it would hold the log as well.

Fourteen Miles First Class Timber For Sale

On Kennedy Lake (fresh water), five miles from salt water by good river, in Clayquot District west coast Vancouver Island, consisting of Fir, Cedar and Spruce, all fronting on water and easily logged.

This is some of the choicest timber on Vancouver Island and each limit will cruise on the average better than 20,000 feet to the acre.

Many of the trees will contain 20,000 feet first class timber. We will sell this proposition at \$2.50 per acre.

"THE DUNBAR"

New and Improved

STEAM LOGGING ENGINES

Best on the Market

This is the machine for which we claim all the good qualities possessed by any other and a great many valuable improvements besides.

The frames of the Dunbar engine are steel of heavier section and reinforced at all points where others have lacked strength.

The driving and carrying shafts are heavier, the crank shaft being 5 inches in centre tapered to 4 inches at ends, and the carrying shaft is 5 inches diameter.

All connecting rods, link motions and joints are milled from solid steel, which will all joints and pins are case-hardened.

The carrying beds are faced with cast steel 4 inches wide, and rest on four endless chains fitted with case-hardened steel rollers $3\frac{1}{2}$ inches by 3 inches spaced at $4\frac{1}{2}$ inches; these rollers and chains are carried over top of wheel frames on steel shoe plates 4 inches wide.

The travelling chain is 16 inches wide, 2 inches thick, and has a base bearing on the road of 5 feet 6 inches by width of chain, viz., 16 inches.

The driving gears have 5 inches face; these and the compensating gears are steel and cut from the solid.

The draw bars are steel and fitted with compensating springs.

The engine, frame and boiler rests on heavy spiral springs which are placed in heavy steel housings.

The tender is enlarged so that wood may be carried for fuel.

The boiler is locomotive style and tested at 265 lbs. to the square inch.

The fire box is 5 feet long and specially deep.

The boiler may be raised or lowered as desired, so avoiding the difficulties arising from irregularities of the road (this idea we propose having patented at an early date.)

The equipment of injectors and gauges are complete, each engine having a duplicate set. Injectors are specially made for high pressure and are "positive."

The boiler is fitted with two pop safety valves.

All bearing boxes and eccentric strap are phosphorous bronze and spot babbitted with genuine aluminum metal of the highest grade.

They have head lights, whistle, locomotive cylinder lubricators, oil and grease cups.

Each machine is fitted with a water-lifter and 25 feet 2-inch best grade rubber hose for filling tank, which has a capacity of 600 gallons.

The tanks (which set over the boiler) are made from $3/16$ steel.

The boilers and steam pipes are covered with extra thick air spaced asbestos, lagged with wood and covered with iron.

Weight is about seventeen to twenty tons without and with water respectively.

In the construction of these engines only the best material and workmanship are used.

As these engines take considerable time in construction and will not be kept in stock, it will therefore be necessary to place orders for next season's delivery with as little delay as possible.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

THE CANADA LUMBERMAN AND WOODWORKER is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., the CANADA LUMBERMAN AND WOODWORKER is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "WANTED" and "FOR SALE" advertisements.

TORONTO — MAY 1, 1908 — MONTREAL

Railways Propose to increase Lumber Rates.

Lumber dealers in Ontario, particularly those at Toronto, Hamilton and other large centres, together with the manufacturers at the mills in Northern Ontario, are feeling-anxious about the change of rates which the G. T. R. and C. P. R. have prepared and are arranging to put into force, for the carriage of lumber and forest products after May 1st. The rates in force at the present time are those which have been in existence for a long time past. The various schedules containing them were so numerous and difficult to understand that the lumbermen were continually hampered by them. When the Dominion Railway Commission was recently investigating the alleged lumber combine, they became so confused by the varying schedules that they ordered the preparation of a new list, which was to be completely contained in one book. The railway companies have now prepared their list, and advance copies which have come to some of the lumber dealers are causing them a great deal of anxiety. The rates show quite an advance for Toronto from outside points, and an even greater advance for Hamilton. The advances are found to apply almost entirely to the large centres where the bulk of lumber is shipped to, and what reductions are to be made relate to places where comparatively little lumber goes. The Canadian Manufacturers' Association have taken the matter up. Mr. Walsh, manager of the transportation department of the association, went to Ottawa last week, to place the matter before the Board of Railway Commissioners, and to ask them to prevent the tariff from being brought into effect until the manufacturers have had an opportunity of protesting against it.

To show that the anxiety of the manufacturers is not ungrounded, the following list of changes will suffice. The first figure given refers to the old price in cents for the shipment of one hundredweight of lumber in carloads from the point named, and the second figure is the price which is to go into effect according to the new schedule:

To Toronto, from: Windsor, 8 1-2, 10; Sarnia and Point Edward, 8 1-2, 9; Goderich, 8 1-2, 8 1-2; Kincardine, 7 1-2, 9; Southampton, 7 1-2, 8 1-2; Trenton, 7 1-2, 8; Lindsay and Lakefield, 7 1-2, 8; Cobocok and Haliburton, 7 1-2, 8; Midland, Penetang, Collingwood, Victoria Harbor, Owen Sound, Waubashene, Fesserton, Sturgeon Bay and Longford Mills, 7 1-2, 8; Falkenburg and Huntsville, 8, 8 1-2; Novar, 8, 9; Sundridge, 9, 9 1-2; Trout Creek, 10, 9 1-2; Powassan and North Bay, 10, 10 1-2; Depot Harbor, 9, 9 1-2; Whitney, 10, 10 1-2.

The rates to Hamilton are as follows, from: Windsor, 8, 9 1-2; Sarnia and Point Edward, 8, 8 1-2; Goderich, 7 1-2, 8; Kincardine, 7 1-2, 8 1-2; Southampton, 7 1-2, 8 1-2; Owen Sound, Wiarton, 7 1-2, 9; Trenton, 7 1-2, 9 1-2; Cobocok and Haliburton, 7 1-2, 9; Midland, Penetanguishene, Collingwood, Victoria Harbor, etc., 7 1-2, 8 1-2; Falkenburg,

8, 9; Huntsville, 8 1-2, 9; Novar, 8 1-2, 9 1-2; Burk's Falls, 9, 9 1-2; Sundridge, 9, 9 1-2; Trout Creek, 10, 10 1-2; Powassan and North Bay, 10, 11.

From nearly every point, therefore, to Toronto and Hamilton, the rates are raised from a half cent to a cent and a half. Manufacturers have complained from time to time about the poor service they receive in the matter of cars, and have been met generally with the excuse that the congestion of traffic prevented the railways from doing any better. But at times when the congestion is relieved, they do not fare much better, and as a rule can depend upon having to await the pleasure of the railways before obtaining cars. Frequent delays in business are caused, and even loss of business results from inability to deliver.

The lumber market to-day is in a great state of uncertainty. Matters may improve shortly, but in the meantime the trade is looking ahead pretty anxiously and wondering what the future has in store. If demand does not pick up quickly the season will be well advanced before much business has been done. Coming as it does at such juncture, the decision of the railway companies to increase their rates cannot fail to have a depressing effect upon the trade. It is probable that by discouraging shipments it will even become something of a boomerang to the railways. Nor will the effect be felt solely by the manufacturers and dealers in lumber. An immediate result will be an increase in the price of lumber. Building operations will be correspondingly reduced, and the effect will filter away through a number of trades, inducing those in each of them to curtail their operations, to the extent that they are effected. Railway companies have the reputation of being in the habit of charging all that the traffic will bear. In this instance it looks as though they were doing their best to deserve the reputation. The lumber industry will have no recourse in the end, but to pay whatever charges are demanded. They have only one hope to fall back upon, namely, the interference of the Dominion Railway Commission, whose duty it is to see that the public are not unjustly mulcted for the sake of making up to the railways the decrease in returns which they have recently suffered, and which they should be willing to share in common with every other class of business, whenever depression prevails, as it has of late. The best way to relieve depression is to talk prosperity. The course now taken by the railway companies is a strong argument in favor of their belief in the continuance of hard times. If they wish to help in bringing about good times they will not take advantage of the Railway Commission's order to simplify their tariff, by introducing a general increase of rates.

Sale of Dokis Indian Reserve.

The Government will sell by tender on June 24 at Ottawa the timber on the Dokis Indian Reserve, on the south side of French River. The pine on this reserve has been surrendered by the Indians and will be put up at auction. The proceeds will go to the credit of the French River Band, and as the pine is estimated to be worth about \$1,000,000, the Indians will be pretty well off. Before his death, Chief Dokis entreated the band not to sell this timber, but the majority of the band have now decided in favor of the sale. Mr. D. P. Cockburn, Indian Agent, is acting in the interest of the Indians. It does not seem that the interests of the Indians will be as well served by the sale at the present time as they would be if it were postponed until the market has improved. Most of the pine is good stuff, though small. It consists of white and red pine mixed. Being under the charge of the Dominion Government, this timber, when cut into logs, could be exported to the United States, as the regulation requiring manufacture within Ontario is only a Provincial law. There is no probability of these logs going across the border, however, because, since the passage of the Provincial law, so many mills have come from Michigan to the Canadian side, that Ontario logs can be more profitably cut up in Ontario mills.

An Incubus Upon Western Development.

The improvement in business conditions throughout the West, which began to make itself so noticeable pretty generally about the end of March, is keeping up and increasing. Early seeding and fine weather have already done much to assist those who are living close to nature in the Canadian West, and their buoyancy is communicating itself to the rest of the country. Building operations are on the increase everywhere throughout the West. In older Canada, though they are only steady in some places, a few of the large centres report that with the arrival of warm weather the demand for buildings has suddenly increased. In the West, however, building operations, and with them the demand for lumber, are still severely handicapped by the high rates for money. Loan companies still continue to charge from 9 to 10 per cent., and as long as they are able to get it there is no doubt that they will charge it. Men of enterprise in the West are feeling this handicap severely. Yet they are to a great extent the victims of circumstance and do not at present look forward with any great confidence to a reduction of the rate. The influx of population to the West, especially that of the well-to-do farmers from the United States, is helping to maintain the high rates for

money. They must have buildings and as they are supplied with a certain amount of money, they do not feel the hardship of the high rates so much as they otherwise would. It is upon the building and commercial operations generally, in the large centres that the burden weighs heaviest. The loan companies are to-day obtaining their money from England at three per cent. and are loaning it in the West at from 8 to 10 per cent., more frequently the latter. They are reaping a pretty rich harvest. They will excuse themselves, of course, by calling attention to the risk they have to run, of losing heavily on their loans whenever the country sustains a financial setback. Surely, however, a profit of from 6 to 7 per cent. is sufficient to ensure them against this risk and to provide them with a handsome profit. Last winter they stopped loaning money altogether for a time, and took measures to be prepared for realizing on their loans in case of trouble. They found that such was the confidence of the people of the West in their own future that they, the companies, would have been able to meet all current demands from restless debenture holders in the old country with little trouble. When the debenture holders realized this their restlessness came to an end, and as soon as matters began to mend the loan companies were able to continue their business at the old rates. This was not chronicled in the press to any great extent, but it was a significant fact, and showed that the people of the West and of the old country, both, had faith in the future. As matters stand to-day, a strong argument can be presented in favor of the loan companies doing their best to encourage business activity in the West by reducing their rates of interest.

U. S., Pulpwood and Woodpulp Imports.

With so much discussion going on about the export of pulpwood to the United States, it is interesting to note the amount of woodpulp being imported by that country. While the imports have slackened up a little, they are yet of large volume. In February, 1908, they imported 16,486 tons, valued at \$484,796, as against 20,369 tons, valued at \$603,563 in February, 1907.

In the eight months' period the figures show increases. In the eight months ended February 29, 1908, they imported 184,210 tons, valued at \$5,512,300, and in the eight months ended February 28, 1907, 137,558 tons, valued at \$3,078,454. The countries from which importations originated and the values of the shipments are as follows:

	1907.		1908.	
	Tons.	Value.	Tons.	Value.
Germany	10,043	\$509,315	25,311	\$1,090,696
Norway	16,215	892,342	12,809	621,505
Other Europe	11,233	483,764	30,444	1,283,909
British North America . . .	100,067	2,093,033	115,655	2,516,190
Total	137,558	\$3,978,454	184,219	\$5,512,300

Of pulpwood, they imported 397,647 cords, valued at \$1,742,004 in the eight months ended February 28, 1907, and 610,944 cords, valued at \$3,224,222 in the eight months ended February 29, 1908.

The U.S. Lumber Enquiry Fiasco.

In view of the recent enquiries into Canadian lumber conditions and alleged combines, it is interesting to note that the American enquiry has resulted in a fiasco. The American Lumberman, speaking of the matter, says: An analysis by a disinterested reader of the testimony adduced, solely upon the part of the inquisitors, would demonstrate no other prominent results than complacent contemplation by the lumbermen involved, mortification by the State authorities and generally a waste of time. The purpose of the States' attorneys of three States was announced with more or less of a blare of trumpets, the volume of fanfaronade increasing as the date of the investigation approached, as the establishing of criminal violation of federal laws by lumbermen—in proportion to their numbers concededly the most law-abiding citizens of their communities. The net results to what may be called the prosecution in this case are a "water haul" that reflects little credit or dignity upon those responsible for it.

The initiation of this investigation seems to have been due to two primary causes—the turning over to the State authorities of correspondence and a desire by those authorities for location in the limelight. Correspondence of a frankly enlightening character was offered freely to the inquisitors by the some-time secretary of a retail lumbermen's association. It is a monument to the zealous loyalty of its authors—the secretaries of various lumbermen's organizations. The dominating spirit of it is respect for the law, with perhaps here and there a possibly mistaken, slightly free interpretation of the law.

Upon that interpretation the State authorities built a flimsy structure of methods abandoned by the lumber trade and their organizations years before the investigation was inaugurated—of methods none of which are, or within a reasonable period have, been applicable to commerce claimed to be held in restraint. So justifiably complaisant as to the outcome were the lumbermen involved that, while they treated the

hearing and those active in prosecuting it with outward respect, they evidenced their indifference to it by according it no other attention than perfunctory representation by counsel.

The States authorities sought by incessant, reiterated questioning to adduce admissions damaging to the position of the lumbermen; they were met by frankly offered evidence, oral and documentary, up to and even beyond the limit of their questioning. They ascribed as the cause of changes in the methods of selling lumber a fear of the law; they establish incontrovertibly and repeatedly a thorough respect by lumbermen for the law, not only in letter but in spirit—a firmer attitude of the lumber trade in respect to its good citizenship.

Concrete results of the recent hearing are the firmer position of the lumber trade as law respecting citizens and success of the legal representatives of three States in making themselves and their cause absurd.

English Market Picking Up.

English advices report a slight tendency towards improvement in the British lumber trade. Things are not quite so lifeless as they have been for some months past, but the improvement is only of the very slightest. Some Manchester firms seem not even to recognize that they are increasing and that enquiries show a great improvement on the sluggish has been any improvement. Other reports state that actual business is state of things which have prevailed of late. Most of the stocks sold have been of the commoner sorts, and in many instances further concession prices have been made. Just a little more life is discernible in spruce. A cargo or two is offering, shippers anticipating about \$40 c.i.f. for the usual 50-60 per cent. of narrows. The ball must start rolling soon. Stocks are being depleted and even on a hand to mouth policy must be replaced. The position is too uncertain to say much about it. Quebec spruce is beginning to move. Some fair lines have been placed at prices similar to last year's opening values.

London sales have been very small, but this need not be looked upon as an altogether bad sign. There are many firms in England that have not bought a stick of wood this season. Apparently they are playing a waiting game, and it would not be surprising if it should result in more harm to them than good. There is very good reason to expect a more cheerful tone a little later on, both in regard to the prices and demand.

U.S. Wood Pulp Tariff Stands.

A Washington despatch says there will be no revision of the tariff for the benefit of newspaper and magazine publishers. Such was the declared effect, if not purpose, of the Cannon resolution adopted by the House recently, which provided for the appointment of a committee to investigate and report whether or not there was a combination to force up the price of paper, and what effect the tariff on wood pulp and print paper had upon the price of the latter article and upon the forests of the United States.

As set forth in the resolution, the duty of the committee is to investigate "and obtain all possible information" as to the reasons for the increased price of white paper, "to the end that needful legislation may be enacted."

A protest on the part of fifty big paper manufacturers of the United States against the proposal to remove the tariff on print paper, pulp, and pulpwood, is about to be filed with the House and the Senate. Delegations representing paper manufacturers are arriving here to enter their opposition to the movement.

Railroads Growing Their Own Ties.

An interesting development in modern railroading is the establishment of departments of forestry for the purpose of providing future supplies of cross ties and fence posts, when nature will have been thoroughly robbed. The Pennsylvania Railroad inaugurated such a policy of preserving its wood supply as far back as 1902. While the object was first of all a commercial one, there was still another aspect, in that the operations on the lands of the company were expected to encourage forest planting among individuals who owned land adjacent to the railroad and so aid the general forestry movement.

At the time the department on the Pennsylvania was authorized a maximum yearly planting of 2,000 acres was anticipated, but that acreage has not been approximated. In the fall of the first year 13,610 locust trees were set out on a company farm near Vineyard, Pa. Annual planting of these trees has been since continued, until at the present time there are forty plantations between Coatesville and Altoona, representing in the aggregate about 1,855,000 trees. The planting has been done on farms ranging from 20 to 200 acres in extent, which were obtained in connection with the widening and extension of the main line and the building of new freight lines.

Market Correspondence

Lumber Commencing to Move at Ottawa.

Ottawa, April 22.—The shipping of lumber from J. R. Booth's well-filled stock yards at the Chaudiere will begin actively next week. It is expected that a considerable quantity of this lumber can be removed to Montreal by barge on the Ottawa river in time to catch six of the large freight steamers expected to land about the first of May and receive loads for ten or twelve days. Messrs. Cox & Burstall, who handle the shipments, which are mostly deal for the English market, are waiting for instructions from the steamer agents as to dates of departure, after which they will begin the season's shipping.

Mr. Cox, who has been in England for the past month, will be back in Canada about the opening of navigation. These shippers look forward to a season as busy as last year. Transportation by barge furnishes a comparatively cheap means of delivering the large output of pine deal from the Booth mill. The whole stream is navigable for barges. Shipments of lumber from points further up the Ottawa are by rail, as a matter of necessity.

In a few days water will be let into the Rideau canal and coal barges will begin to carry large loads of Ottawa valley lumber to the United States market, some of the chief distributing points being Oswego, Clayton, Burlington, Albany and New York.

The fact that buyers held off so long tends to make the latter half of April extremely dull in the lumber trade, as dealers wish to take advantage of the water transportation. There is considerable lumber which will be removed immediately, when the barges begin to run, and the retail yards are looking forward to a brisker trade at that time. Besides waiting for river transportation, dealers hold back from making large purchases, owing to the uncertainty as to disposal. The number of inquiries for lumber from the United States has only been fair in the last fortnight, and the local demand promises to be no more than normal. Sales are very few and prices remain firm, especially in the upper grades of shingles and lath.

Several lumber men characterize the winter just closed as very unfavorable for shanty operation. The snow came early and the fall was very heavy, with excessive cold. Now it is feared that in some quarters the spring floods will escape before the logs are released from the ice. As much pulpwood was held in this way last year, owners of pulp mills are somewhat uneasy about the supply for their mills this spring. The Chaudiere at Ottawa is later than usual in breaking up, and power owners are suffering considerably from low water. Mr. J. R. Booth closed his pulp mill for a time, as operating became difficult, and he took advantage of the circumstance to make repairs.

One of the first mills to start operations will be that of the James MacLaren Company of Buckingham, Que., which is just ready to saw logs in its big mill on the east side of the river. The company started sawing pulp logs last week. Many radical changes and repairs were made in the company's big saw mill, and the prospects are for a large output during the coming summer.

The labor situation is very favorable for mill operations. Manufacturers will have less difficulty in securing men for night work than last year. It is not likely that skilled men will be paid less, but the decline in wages for common labor in other lines of employment indicates lower rates in the mill.

New Brunswick Mills Holding Back.

St. John, N.B., April 23.—Since last writing there has been little activity shown in any department of the lumber business. The extreme lateness of the spring, together with the depression in several of the most important lines, tends strongly toward inactivity on the part of both manufacturers and dealers.

A prominent manufacturer said this morning: "In all my twenty-five years' experience in the lumber business, I have seen nothing that approaches the quiet of the present spring, nor have I seen so many indications of a quiet season at this time of year as are discernible at present."

Mr. John E. Moore said yesterday that he had decided to hold his logs and would not start his mill this season. Several other local mill-owners are giving utterance to similar intentions. While it is probable that a number of those who seem to have such ideas at present will do a certain amount of sawing this year, there seems to be a feeling of entire indifference on the part of all as to whether or not they start their plants this year; their most prominent sentiment in the matter seems to be rather one of reluctance to begin than otherwise. The mills of A. Cushing & Company, Randolph & Baker, Murry & Gregory and Stetson, Cutler & Company, are now sawing; none of the other large local plants have shown any signs of life whatever.

Advices from the upper St. John river tell of considerable uncertainty in regard to stream-driving, although, at present writing, the indications seem to point to favorable conditions. The river is remarkably late in opening. At Fredericton the ice is still strong enough to permit of crossing on foot. From that point to the headwaters, including all the branches and brooks, the ice is still solid and shows little sign of going out.

Advices from St. John river districts of Quebec Province say that there are still from four to six feet of snow in the woods. On the Tobique, reports say that there are from three to four feet and on the Aroostook conditions are very similar to those on the Tobique. When the snow hangs on so persistently it is usually the forerunner of a favorable season for driving logs. When it does not begin to melt until late, it is very apt to go quickly when it does begin to melt, and the result is a good volume of water. Should the warm weather come slowly and the snow melt gradually, the water would run off by degrees and a light freshet would be the natural consequence. While these elements of uncertainty exist it is scarcely possible to make any conclusive assertion at this early stage.

In the lower counties, there is every indication that many logs will be left in the woods. In these sections the snow has been very scarce all winter and has practically all disappeared, while the ice in the brooks and streams is still solid.

The first of the bank logs have not yet begun to arrive. These logs, coming from the Nerepis, the Belleisle, the Washdemoak and other nearby branches of the St. John, are always first on the market and are usually snapped up at high prices. This year the demand for them is very light and prices are correspondingly low. Several jobbers who have small lots to sell have been in town to get figures and have been unable to get any better offers than \$10.50 per thousand superficial feet for spruce deal logs, two-thirds price for battens of less than eleven inches at the top end, delivered at St. John.

It is estimated that there are about one and one-half millions of feet of spruce and cedar logs scattered about the river between the head of Long Reach and Fredericton. A crew of forty-five men, with three tugs, are engaged in picking them up in order that they may be towed to St. John and sorted.

The local shingle sawyers' union met a few days ago and passed a resolution to the effect that they would not accept a reduction of ten per cent. in their wages. The manufacturers proposed a return to the rate which was current in 1906 and for some years previously, which would mean a reduction in the sawyers' pay from \$2.20 per day to \$2 per day. The result is that, in such mills as are running, the shingle machines are idle. There have been no shingles manufactured in St. John or vicinity for some weeks, and, as the manufacturers assert that they will not pay the higher rate, the outlook for production in this line is the reverse of encouraging.

In the four plants now running, the crews of the spruce mills have accepted the cut and are working at the same rate of wages as was paid them in 1906, which is ten per cent. lower than the rates of last year.

Camping Operations Concluded.

The Labor Gazette for April, referring to lumbering, says: "Operations in the camps throughout Ontario and the eastern provinces had, for the most part, ceased by the closing days of the month, and preparations for the drives were under way. In New Brunswick a lack of snow interfered considerably with the hauling of logs to the streams, but elsewhere good progress was made. An exceptionally large quantity of pit timber, for use in the collieries, has been taken out this winter in Nova Scotia. Wages of rivermen will be on a lower level than last year, but scales will probably be well maintained in the mills, where, notwithstanding the falling off in the cut, the large quantity of logs left over from last year will render the season an active one. It is estimated that the total amount of logs got out on the Miramichi River, N.B., will be 110,000,000 feet, compared with 180,000,000 feet last year. Some 2,000 men will be employed at the Booth mills at Ottawa during the coming season, a slight increase compared with last year. The sulphite mill, under construction, will commence operations early in the summer and will employ 100 men. Prices paid for pulpwood this year have been exceptionally high.

"In British Columbia, conditions were still quiet, though there was an improvement in some of the coast mills and camps, compared with 1907. It is estimated that about 400 men were engaged in the Boundary district in getting out railway ties, over 400,000 having been made. A quiet season is expected by shingle manufacturers in British Columbia; prices are somewhat lower than last year."

Canada exported in 1907, \$33,587,474 worth of forest products; \$11,783,564 to Great Britain, \$18,397,753 to the United States.

The Dominion Government sold in 1906-7, 49 timber berths with an area of 410.6 square miles. The bonuses amounted to \$226,360, or an average of \$511 per square mile.

The British Columbia Trade

Vancouver Building.

Building activity is extensive in British Columbia generally and in Vancouver particularly. In this city enormous increase is shown not only in comparison with previous local statistics, but with the figures of other cities. During the entire month of April last year the total permits granted by the department amounted to \$235,710, while during the first week of April this year the figures were \$240,830, or in round figures \$5,000 above the total for the entire month of April, 1906.

The present building activity is not spasmodic, for there has been an increase every month since the beginning of the year. In January the figures were one hundred per cent. over the corresponding month of last year. The February figures were also in advance of February, 1906, while March was slightly ahead, and April will bring up the average greatly. For the first three months in the year the surplus over the corresponding period of last year was nearly a quarter of a million dollars. This building activity is all the more marked, as building statistics from the leading cities in the States show a decrease over last year in almost every instance. Since the beginning of the year Vancouver has been in the unique position of leading the entire continent in percentage advance in the building line.

One of the pleasing features of the great activity in building in Vancouver is that no trouble is feared with the unions. For years the builders have been striving to adopt the policy of paying for merit only; that is, paying a man what he is worth. The unions looked at the matter differently, and after increasing wages to an exasperating point, demanded that skilled and unskilled labor should receive the same wage in each line of work. The few builders who had courage to break away from the unions fared well. The great majority, however, feared to take this step. The aggressiveness of the unions, however, solved the problem. They struck for still higher wages at a very busy time, and refused to go to work, to a man, unless all the builders gave in at once. At this time, the Employers' Association took a hand in the business. The building trades unions, realizing that they had an uncompromising body to fight, with justice on their side, advised all employees to save themselves, and there was a general scramble to induce individual builders to sign up. Only a few of the smaller firms did so, but all the larger firms declared for open shop. To-day carpenters getting \$4 a day are working side by side with carpenters getting \$3 a day, and workmen are paid on their merit. The only union recognized are the bricklayers, and it is because they are amenable to reason. They get sixty-two and a half cents an hour, for actual work, and are only paid for actual work, the employer laying them off at pleasure. The card system, which was such an evil two or three years ago, has been done away with, and builders taking contracts with lumber at rock bottom, with an upward tendency, can figure more safely than for years past.

A Menace to Western Lumbermen.

The enforcement of clause XII. of the Dominion timber regulations, which means that anyone holding timber in the Dominion belt, along the railway for twenty miles on either side, must cut from each limit a specified amount of timber each year, came like a bolt from the blue, into the camp of many holders of Dominion timber. The hardship is aggravated by the fact that the regulation comes at a time when the mills are stocked with lumber and there are many millions of feet of cheap logs in the water. It is argued by the Federal Government that they experienced so much grafting in other parts of the Dominion, that they decided to put a stop to it by issuing a general order. It is to be feared that one result will be that vested interests will suffer greatly, and many limits will be greatly reduced in value. It would be impossible for holders in all cases to comply with the demand and the order, if enforced, may result in practical confiscation of some valuable limits, for which a large price was paid. An impression prevails that when the Dominion Government realize the effect of the order they will either amend it or make it inoperative, until further notice.

British Columbia lumbermen are opposed to the enforcement of the order and some believe that it was issued solely in the interests of the farmers. While sympathizing with the farmers and desiring them to get lumber at good prices, the government has also a duty to the British Columbia lumber industry, and must be careful not to demoralize it for the sake of the farmers.

The Prairie Provinces will probably never be able to secure what is called cheap lumber. Freight rates prohibit this, not mill prices. British Columbia merchants claim that they are in the same condition in regard to food stuffs, as distance and a protective tariff for the farmer prevent the cheapening of flour in that province. There is no desire on the part of the mill men to condemn the Government on partizan lines,

and it is reasonable to hope that a strong delegation, sent to Ottawa to explain to the Government the true state of affairs, will have the desired effect. No one can say how long it will take to recover from the depression in the lumber trade under present conditions. With the extra handicap of millions of feet of lumber forced upon the market, the situation would be serious.

The overproduction of the past has been caused partly by heavy taxation on timber, and by the fact that mills are always looking for fresh limits for operation. On the Pacific an additional aggravation is caused by the difficulty of finding a market for low grade lumber. In Quebec it was found convenient to abolish timber regulations requiring holders to cut a stated amount of timber, owing to overproduction. Overproduction in lumber is injurious to every industry in British Columbia. When the lumber industry is stagnant, the entire industrial world of British Columbia is injuriously affected. Legislation should be towards limiting production rather than forcing products upon the market. If the cut of forests is forced now, it means an enormous waste of lower grade material. In other countries the tendency is to conserve, not to destroy the timber resources, and forcing the cut now amounts to a destruction of the timber. It would be a backward policy rather than the wise legislation of a parent government.

U.S. Lumbermen Investing in B.C.

While there is much difference of opinion regarding the immediate future of lumber in British Columbia, all are agreed that standing timber is a most valuable commodity. This fact is brought home more effectively to lumbermen in the United States than it is in British Columbia. The temporarily depressed condition of the lumber market has practically no bearing on the value of standing trees. In the United States the forests are becoming rapidly depleted and millmen on the other side are turning their attention to British Columbia. At the present time a small army of United States prospectors are preparing to go into the woods. Some of them are already on the ground and had intended to commence prospecting at once. They have found, however, in most cases, that where the timber is thickest, snow is lying on the ground as deep as the arm pits. One Wisconsin firm has taken an option on a British Columbia area of timber many miles in extent. They will prospect the ground thoroughly during the first week in May. This firm states that their own limits are worked out and they must have timber somewhere. They have decided to buy in British Columbia, establish mills, and ship to the best available market. The wise laws of the Provincial Government have resulted in millions of United States money being invested, in this way, in British Columbia.

It is expected that a great impetus will be given to the lumber industry of British Columbia when the Panama Canal is opened for traffic. The Government realizing this are striving to discourage speculation. They will sell no timber, and will only issue licenses to cut from unoccupied ground, from year to year. In this way, if licensed timber is held for speculation and not cut they will get \$140 a year from the license holder and the land and timber ultimately will revert the province.

Dissatisfied Builders.

Western newspapers were very diligent recently in circulating information that there had been a drop in the price of lumber. Owing to the newspapers and the public not going into details, an erroneous impression got abroad that the decline was in all grades, while in fact it was only in rough. In cities the lesser cost of rough lumber does not figure greatly in the building of a good house of modern architecture. Therefore there were undoubtedly some disappointed buyers when they visited the yards to get lumber at lower prices.

The higher grades of lumber as a matter of fact have always kept up well in price, on the coast, and when the price of lumber is spoken of, rough lumber is quoted as a basic price. As a matter of fact, the mills could not keep running if they sold the higher grades correspondingly as cheap as the rough, the latter being looked upon more or less as a staple, just as the grocer looks upon sugar and bread, articles that they must sell along with other goods, but on which there is little or no profit.

It is a fact that sales of bevelled siding have recently been made by British Columbia mills to Puget Sound yards, this lumber being actually laid down on the other side cheaper than the United States mills can deliver it. The British Columbia mills are quite satisfied to sell this lumber at the price secured from the United States customers. The mills, therefore, do not make anything by selling rough lumber as cheaply as at present, nor does it in any great measure benefit the builders.

Prices of B. C. Logs Advancing.

Not so very long ago prices of logs and lumber were violently bumping bottom, but they recovered so quickly that before they could be chronicled in the periodical journals, they had become normal again. It appears that the cause of the trouble was the reaching out of the small mills for what little business was going, by quoting lumber at less than what the big mills could sell it for at a profit. The small mills did not belong to the Manufacturers' Association, and had nothing to lose and everything to gain, as they had been buying some of the cheap logs and could afford to sell underneath the mark. The Association mills, however, were differently situated, and for their own preservation announced to the little mills that if lumber was to be sold cheap, two could play at the same game. The big mills then took a part in the business, to the delight of the consumers who were on the inside. It was a short, sharp struggle, and the industry as a whole benefitted by it, as prices were restored to list figures, and many of the small offenders joined the Manufacturers' Association. About the time that lumber was bumping bottom, a boom of fair fir logs was sold in the open market at the rate of \$4.50. The owner was hard up and took so much for the lot, and when the boom was scaled it was found that the price averaged \$4.50 a thousand. If this is not the lowest, it is one of the lowest prices ever reached for fir logs. When logs were selling years ago at \$6, it was thought that they would never reach that point again, but logs have been just about as dull the past few months as they ever have been, so far as fir is concerned, although cedar logs show considerable strength in comparison. It is said that logs which were selling during the recent activity at \$11 and \$12 can now be bought at \$7 and \$7.50.

Shingle Business Quiet.

Matters are remarkably quiet in the shingle business in Western Canada. It is reported from the Prairies that trade will commence in May. That, however, remains to be seen. The Shingle Association have been very careful not to overload the market, and in this respect have more control over matters than the millmen, who cannot prevent glutted lumber yards. Some attention has been given of late to shingle specifications. No definite action, however, was taken, as it was considered, all things taken into consideration, that the British Columbia shingle grading was quite satisfactory. The grades are not numerous, and they are being carefully maintained. In fact specifications have been so closely followed that there is no doubt British Columbia shingles have earned a name for themselves in the markets of the world, not only for quality, but from the fact that they are delivered to the customer as represented by the mill company. This is in contrast with the present conditions in the United States, where it has been found necessary to agitate for uniform specifications.

British Columbia's Protest.

At the recent public meeting in Vancouver of all those interested in lumber to protest against the action of the Dominion Government in enforcing the regulation that holders of Federal timber must erect mills to cut a certain amount of timber each year off the limits or forfeit their licenses, there was a large attendance. Mr. E. H. Heaps, of the lumber firm of E. H. Heaps & Company, and also president of the Board of Trade, was in the chair. He pointed out the importance of the matter, not only to holders of timber licenses and mill operators, but to every industry in the province, as well as buyers in the Northwest. If the regulation be enforced it will mean disaster to many, for the leaseholds are held by men who never expected an order for immediate and continuous logging, consequently they are not in a position to comply with it. The result would be that they would lose their holdings by legalized confiscation.

T. F. Paterson said it behooved the lumbermen to take active measures to prevent the drastic steps proposed by the Ottawa authorities. Letters received by the association showed that the Government intends to enforce the order, and in the present state of the market the lumber industry would be crippled.

Dr. Judson Clark, secretary of the British Columbia Timber & Forestry Chamber of Commerce, thought that while only a limited number of holders of licenses would be directly affected by the order, all lumbermen in the province would ultimately feel the effect. The matter of operating licenses meant not simply the clearing of land for settlers, as had been argued, for the Government in other parts had ordered desirable lands cleared and had frankly stated the purpose of the order. The whole object was to force millmen to cut timber and flood the market with lumber.

The chairman further pointed out that the Governments of Manitoba and Alberta had caused investigations to be made into the conditions of the lumber trade and these had declared that the prices of lumber had not been unduly advanced. More than this, they found that by comparison, the present scale of prices is not too high. It seemed unfair that

an industry so important to British Columbia, and especially one unprotected in any way, should be struck such a blow by the Dominion Government at the present time. To make the lumbermen undertake to carry out this order would work a serious hardship and occasion a great loss to many. He suggested that if the Government wished to cheapen lumber it should pay a bounty to the industry, as it had done to others.

Mr. Paterson said that many holders of licenses simply could not build mills to carry out the regulations, and it meant that the claims must revert. In view of the depression in the trade just now, the enforcement of such a measure spelled ruin in many cases, even in forcing lumber on the market. He said there was enough lumber in the yards of the Kootenay mills to supply the whole Northwest with its requirements for the next six months, and there are enough logs in the water on the coast to last the mills for six months. He did not want to preach pessimism, but these conditions will continue for some time, and if the order is enforced most of the mills will be compelled to shut down entirely.

A motion was carried that a petition be at once circulated, and that a committee send notices to all members of lumber associations, boards of trade, business men and private citizens, pointing out the importance of the crisis and to awaken public opinion, as all interests were vitally affected. It was also decided to hold another public meeting shortly, the date of which will be announced later.

Rising Market Expected in B.C.

A Vancouver report says: Despite the fact that the raising of the export embargo on timber by the provincial government is not having the effect of greatly reducing the surplus of logs on the coast, the natural, though restricted, demand of the sawmills is gradually eating up the over-production, and authorities declare that two months from now will see the advent of a slowly rising market for logs.

For several weeks past it has been possible for the poorer grades of all varieties of logs to be exported to Puget Sound, but instead of a great rush of shipments only a few million feet have been sent across the boundary line. It is now estimated that the logs which will be exported will not exceed fifteen million feet and the great majority of that will consist of cedar, there being practically no demand for fir on the American side.

The present year was ushered in with not less than 160,000,000 feet of logs in the water or ready for the water. Much of this was low grade fir, and because the teredos were working night and day in the logs the provincial government raised the export embargo to help the logger as much as possible. Now between the natural demand of the mills, the ravages of the teredo and a small amount of exporting the surplus has been reduced to about 80,000,000 feet, and it is expected that by the end of sixty days good fir will be on a rising market.

But little logging is now being carried on along the coast. It is estimated by those in touch with the industry that only about one-fifth as much logging is now being done as was the case at this time last year. The demand of the Vancouver mills is greater by a considerable amount than the output of the camps now operating and it is probable that another six weeks will see other camps started up for the summer.

During the month of March the logs scaled by the government totalled 19,000,000 feet as against 31,000,000 feet during March last year.

Mr. G. F. Gibson, manager of the Pacific Coast Lumber Mills, Limited, Vancouver, recently made a two weeks' trip to the Prairie Province. Speaking to THE LUMBERMAN, Mr. Gibson stated that he found the dealers generally carrying very light stocks, and not proposing to carry anything else for some time to come. "Practically all of them," said Mr. Gibson, "are carrying heavy credits, and find collections difficult, consequently they will take very few chances in loading up with stock until the crop is assured. The general opinion seemed to be that if they have a good seeding time, followed by an early summer, confidence will be regained, and if a good crop is harvested, there will be good business in the fall." Mr. Gibson stated that he saw many train loads of settlers coming into the country, two batches he particularly noticed being a group of Irish settlers bound for Saskatchewan and Northern Alberta and a train load of Americans, whose banners on the cars conveyed the intelligence that they were bound for "Sunny Southern Alberta."

Mr. Thomas Harrison, a native of London township, and formerly merchant and postmaster at Thorndale, died at Vancouver, B. C., a few days ago, aged 74 years. In 1886, Mr. Harrison sold out at Thorndale and went to Neepawa, Man., where he conducted with such success a large lumber business. A few months ago, being in failing health, he left for the coast. He leaves a wife and seven sons. The deceased was a cousin of Mrs. (Dr.) Mathieson, St. Marys, and an uncle of Mr. W. N. Harrison, of the Traders Bank, St. Marys.

Would Reduce Hardwood Output.

The United States Hardwood Manufacturers' Association, through its secretary, Mr. Lewis Doster, of Nashville, Tenn., has issued a circular strongly advising the discontinuance of cutting hardwood, until business improves. The circular, which is nothing if not to the point, is as follows:

"A quotation from the Government Report of the Forest Service is as follows: 'The situation in brief is this: We have apparently about a 15 years' supply of hardwood lumber now ready to cut. Of the four great hardwood regions, the Ohio Valley States and the Lake States and the Lower Mississippi Valley are rapidly following their axample. In the Appalachian Mountains we have extensive hardwood lands which have been culled and greatly damaged by fire. These are practically all in private hands, and while they contain a large amount of inferior, young timber, they are receiving little or no protection, and even such young timber as exists is making but slight growth. Even if these cut-over lands be rightly managed they cannot greatly increase their yield of merchantable timber inside of thirty or forty years.'

"The inevitable conclusion is that there are lean years close ahead in the use of hardwood timber. There is sure to be a gap between the supply which exists and the supply which will have to be provided. How large that gap will be depends upon how soon and how effectively we begin to make provision for the future supply. The present indications are that in spite of the best we can do there will be a shortage of hardwoods running through at least fifteen years. How acute that shortage may become and how serious a check it will put upon the industries concerned cannot now be foretold. That it will strike at the very foundation of some of the country's most important industries is unquestionable. This much is true beyond doubt—that we are dangerously near a hardwood famine and have made no provision against it.'

"Now, why cannot the hardwood operator assist the Government in establishing a system whereby the conditions which we believe are of vital interest to the consumer as well as the producer, may be normal. Although the months of January, February and March each showed an increase in business over the preceding month—since December, compared with last year there is a decided decrease in the amount of business in the aggregate, which will hardly be overcome during the next nine months, for the reason that normal business conditions will not become apparent much before the end of the year, if they come at all. It is figured that only about 60 per cent. of the business secured last year will be realized the present year.

"Now, as this condition exists, there should be no more lumber produced than that amount. A large production means a series of low values, and a slower movement of material. The costs of manufacturing have not been lowered sufficiently to meet such conditions without a tremendous loss to the saw mill operators. The river mills are in a peculiar position. They are forced to saw all of their logs which came out with the winter tides and were felled in the woods last year. These mills will continue sawing, but they are not logging, and are running on high priced timber purchased last year when there was a scarcity of logs.

"The interior and mountain mills are only running on logs they have cut down in the woods, and on logs which they wish to save from worms and rot. This condition is more prevalent in the Mississippi valley section than in any other portion of the country. It seems a hardship to the mountain or interior mills away from the river to have to shut down while the river mills are running, but as the river men are not logging this year, and will no doubt be forced to carry over certain stocks for next spring, the mountain mills will be doing business while the river mills are awaiting their log tides the following season.

"This condition has existed in the past, and is a fair one to follow on the see-saw principle. While one section is running the other should not always attempt to follow so fast, and vice versa. The natural results will be in favor of the interior mills.

"Lumber cut now, if held too long on sticks, will go to waste, owing to climatic conditions, thereby losing the opportunity of marketing the cut, which cannot again be reproduced from the log. Forest methods are natural ones, and the wise course, based on past experience and a knowledge of present conditions, would be to cut down trees only when they are needed. By such methods our forests would be preserved; our needs of consumption would be better regulated, and the industry as a whole would be more up-to-date and provided with fresh stocks."

The reports that labor difficulties were probable among Maritime Province lumbermen does not seem to be coming true. A recent report says: It is practically certain that the wages to men working in the saw mills will be 10 per cent. lower than last year. One of the mills which started recently at the reduced rate was besieged by enough men to operate two mills. There is not a very large stock of logs on hand, and the drive may be a little late in coming down. However, a busy year at the mills is now anticipated.

The New Dunbar Steam Logging Machines.

The problem of hauling lumber from the woods to the mills has ever been a vexatious one for lumber operators, for this purpose it is difficult to obtain in sufficient numbers heavy draught horses. To obviate this difficulty various types of steam log haulers have been tried, and have been found vastly superior. The superiority is so manifest that probably in a few seasons few prominent operators will be without a steam log hauler. The superiority is the result of the many advantages economical, durable, and practical—which they possess. It has been estimated that one steam log hauler will do the work of forty horses and will haul from sixty to one hundred and fifty thousand to each load.

The preparation of a suitable road is less difficult than for horse-sleds and teams. Beyond building and smoothing it in the usual way very little account needs be taken of its level or hilly nature, as would be the case for horse teams. Loads are hauled by one of these machines over hills where previously six horses were required to haul a two-horse load and no difficulty whatever was experienced. Necessarily if the road be hilly a smaller sized load would be hauled. The speed of the engine on an average road with a full load would be from four to five miles per hour, whilst the return trip empty would be from six to eight miles per hour.

As regards economy, after the initial expense a very large saving is made. Horse fodder, wages and board of men (counting one man for each pair of horses) are expenses that never grow less, whilst on the other hand when you cease operating the engine the expenses are all cut off, and only the interest on the cost of the machine is to be considered. The demand for such machines is certain to increase as the knowledge of their advantages becomes more general. The "Dunbar" New and Im-

THE DUNBAR STEAM LOGGING ENGINE

proved Steam Logging Engine shown in our illustration is unquestionably a splendid machine and is filling a great want.

The large number of operators in New Brunswick, Quebec and in the State of Maine will make a good demand for these engines.

The shingle machines and other mill machinery made by the Alex. Dunbar & Sons Company, Limited, originally designed by the president of the company, have become well known in mill circles all over Canada and the United States. Their name on machinery is a good guarantee of its character in every respect.

An Official Warning From the United States.

Regarding the depletion of the timber supply of the United States, the recent opinion of Mr. Gifford Pinchot, Government Forecaster at Washington, is interesting. Mr. Pinchot said: "In twenty years' time the timber supply in the United States on government reserves and private holdings, at the present rate of cutting, will be exhausted, although it is possible that the growth of that period might extend the arrival of the famine another five years." Mr. Pinchot had just returned from a six months' inspection trip, on which he travelled 5,000 miles, when he made this statement. In sounding his warning, Mr. Pinchot urged that the danger in the situation be not under-estimated. He said that the United States uses more timber than any other country, and that every man, woman and child will be affected.

It is estimated that the cut of the Michigan saw mills in 1908 will be decreased 30 per cent. from that of 1907. The early estimate was that there would be a decrease of 40 per cent. in the cut, but operations were slightly more extensive than had been counted upon. It is now "claimed" by timber authorities in that state that unless reforestation is extensively practiced, Michigan timber lands will be exhausted in thirty years.

Trade Enquiries.

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of THE CANADA LUMBERMAN AND WOODWORKER may obtain the names of enquirers by writing us. State number of enquiry.

439. Wood Flour.—Manchester firm of general merchants desires to correspond with Canadian lumber firms with a view to importing supplies of wood flour, for which they have inquiries.

443. Maplewood Blocks.—Inquiry has been received from a firm in Holland for the names of Canadian exporters of maplewood blocks.

444. Furniture.—A London firm of general merchants and importers wishes to hear from Canadian exporters of furniture (particularly bentwood chairs) and timber.

463. Lumber.—South African firm of furniture dealers and manufacturers desire to communicate with Canadian manufacturers and exporters of hemlock lumber.

465. Timber, Pit Props.—Belgian firm desires to purchase mine timber or pit props of the following dimensions: 1.60, 1.80, 2.00, 2.20, 2.50 and 3 metres; circumference at the thin end 35 and 54 centimetres. They desire an offer c.i.f. at Calais, Dunkirk or any Belgian port.

466. Timber.—A Belgian firm desires to purchase pine forests suitable for mine timber.

471. Barrel Staves.—Firm of import merchants in Hull are open to hear what prices Canadian firms can offer for shipments of cask staves for cement barrels.

475. Wood Skewers.—Hull firm of merchants invites offers from Canadian manufacturers of maple or hickory skewers measuring from 4 1-2 to 14 inches long and 5-32nds to 5-16ths of an inch in diameter; the larger sizes being put up in bundles of 50, medium sizes in bundles of 100, and the smaller sizes 200 to the bundle.

489. Wood Pulp.—London firm wishes to hear from Canadian shippers of wood pulp.

498. Broom Handles.—London firm can supply polished broom handles to Canadian buyers.

516. Wood Flour.—London firm makes inquiry for the names of Canadian exporters of wood flour to the United Kingdom.

520. Ash Handles.—Manchester firm asks prices and dimensions of ash handles for hay forks and hay rakes from Canadian manufacturers.

530. Broom Handles.—Manchester firm asks prices of broom handles from Canadian manufacturers.

534. Wood.—Manchester firm asks prices of soft white wood for box machine in sizes 10 x 7 v 1-4 inches, also 24 x 16 x 1-4 inches, from Canadian manufacturers.

536. Bungs.—Manchester firm asks for samples and prices of compressed and other bungs from Canadian manufacturers.

Low Water in New Brunswick.

A report from Blissville, N.B., says that the cold weather of the early part of April has resulted in the sudden dropping of the water in the streams, and it is feared that few of the lumber drives in this section will be got into safe water, unless there comes warm weather and heavy rains very soon. In South Branch Lake are 1,500,000 feet owned by J. A. Gregory, which will be driven by Hoyt & Hoyt. The Oromocto Lumber Company, Limited, has a large drive in the Rockwell and will bring up the lumber to their improved mill at Central Blissville.

There seems to be little chance of the drive in Watters' Brook on the Nerepis, under contract to H. W. Woods, of Welsford, coming out, as the brook is now only at summer height, and the logs are still on the landings.

Ottawa and Georgian Bay Conditions.

Conditions in the Ottawa valley and Georgian Bay are thus summarized by the American Lumberman:

A late sale of 3-inch white pine deals for the English market by J. R. Booth, of Ottawa, reveals the fact that there has been a notable reduction of percentage in the higher qualities, as compared to the total production. At the same time prices last year were high relatively to the average quality. This discrepancy between quality and price, as compared to that relation in former years, is causing dissatisfaction among British dealers and this season it has been the cause of hesitancy about closing contracts for cuts of Canadian deals, judging by reports received from several of the larger London and Liverpool importing houses. On the strictly higher grades it is understood that prices in the Booth sale show an advance on last year's prices.

Few contracts have yet been made on thin lumber. It is reported that manufacturers of the Georgian Bay district have intimated that they make some reductions from prices prevalent last year, and buyers expect that Ottawa manufacturers will, as a matter of policy, submit to like reductions. But several of the leading saw mill concerns are not inclined to follow the alleged lead of the Georgian Bay district produc-

ers. The Ottawa valley operators say they have greatly curtailed the last winter's cut of logs, while logging was extraordinarily expensive on account of the weather, and they feel justified in maintaining prices.

In the last few years advances in the prices of pine lumber have improved the prospects for spruce and hemlock in the view of the Ottawa operators. In Canada prices seem to be holding firmer than in the territory west of Lake Huron in the States. Prices at Ontario mills are said to be holding steady at \$14 to \$16 a thousand, mill culls out, which are considered good prices as compared to \$6 a thousand, which was the figure a few years ago. Hemlock has been shipped to the New York market at prices reaching \$20 a thousand, a fact that convinces Ottawa manufacturers that hemlock is becoming an increasing substitute for pine for building purposes. Hemlock and spruce are gaining headway in Ottawa for structural work.

It is felt among Ottawa manufacturers that as a producing and shipping centre it should have the dominating influence in the making of prices for Canadian pine lumber. So far inquiries have been more numerous than contracts and sales, which leaves the price question somewhat in the air. It is expected that when enterprises dependent on the money conditions take definite form the season's lumber requirement will develop in such proportions as shall enable manufacturers to establish a well recognized basis of prices.

Keep Canadian Pulp at Home.

The pulp and paper section of the Canadian Manufacturers' Association at a recent meeting at Montreal decided to continue the struggle for the absolute prohibition of the pulpwood exportation from Canada. The meeting was called in view of the recent movement in the United States to take the duty off pulp and it was debated whether or not in such an event the Canadian manufacturers would be willing to let pulpwood be exported without hindrance to the United States. The decision to continue the fight for prohibition was unanimous and was based on the ground that such a policy made for the better preservation of the Canadian forests and the more rapid development of the Canadian industry.

Good Machinery a Necessity.

Many saw mills have been putting off making improvements, to the last possible moment, in the hope that there would be an advance in the price of lumber and a decided improvement in the demand. One good result of the situation is that lumber is being manufactured with less waste and greater care than usual.

Contrary to what was the rule for some time, the cost of production and the quality of lumber are now considered more important than the size of the output. The supply, actual and potential, is so much greater than the demand, that buyers are exceedingly critical, and only lumber that is accurately edged and trimmed finds ready sale. The Gordon Hollow Blast Grate Company, of Greenville, Michigan, manufacture an edger and trimmer known as the "Power" which they claim will help materially in bringing business to the mill.

An Opening in New Zealand.

An enquiry has been received from the Commercial Agency Company of Dunedin, New Zealand, on behalf of a Dunedin firm who wish to get into touch with a lumber mill or company that can supply, at first hand hardwoods, such as oak, ash, walnut, mahogany, etc., also with another company that can supply soft woods such as basswood, white pine, etc., and lastly with a wood pulping company. The firm notes that the goods would have to be shipped and so if the freight to port of shipment is too great, it will spoil the line. They do not mind which coast the stuff is shipped from, although the Pacific would be the quickest. The timber is to be sawn into planks, but not dressed in any way. It will require to be well seasoned or kiln dried.

South-Western Ontario reports show little change in prices. It is expected however that a stiffening of prices will soon occur. Prices of yellow pine may be expected to stiffen considerably, as much as \$5.00 per thousand. Yellow pine prices have been badly demoralized in the past six months. The raising of yellow pine prices would have a tendency to strengthen both hemlock and pine prices.

The 1908 edition of "Five Thousand Facts About Canada," compiled by Frank Yeigh of Toronto and published by the Canadian Facts Publishing Company is replete with useful information. No small amount of its space is devoted to the presentation of useful information about lumber.

The Huther Bros. Saw Manufacturing Company, Rochester, N.Y., have issued their catalogue No. 26. It is tastefully published and illustrates forcibly the excellence of the company's products.

English Merchants are Anxious.

The lumber dealers of Great Britain feel the pinch, very quickly, when supplies are short and prices soar. Being obliged to import entirely, they are at the mercy of temporary market conditions more than others. Mr. Lewis Miller, timber merchant, of Chieff, speaking of the situation recently, expressed great anxiety. "The outlook is serious," he said, "and I have no hesitation in saying that in twenty-five years we shall be face to face with a timber famine."

Mr. Miller has made frequent journeys about the world, investigating timber resources. Continuing, he said: "Sweden is very much exhausted and laws have been passed forbidding the cutting of timber, standing 1,000 feet above sea level, except with the sanction of the government; and compelling those who cut down trees to replant the ground. They are also planting from seed very extensively. The Swedish Government has put an export duty on timber, and this revenue is being devoted to replanting. From Sweden you turn to Norway, Finland, and Russia to find that all these countries are very much exhausted, and the experience is the same with the forests in Eastern Canada that are accessible to the European market. Indeed, in Canada, if the Government were to enforce the law, and prevent the cutting down of trees under the legal dimensions, three-fourths of the mills there, manufacturing for the European market would have to shut down."

After speaking of the shortage in Scotland, he referred to British Columbia, saying there was plenty of timber on the Pacific coast, but the cost of bringing it to England was far too great. The same applied to Russia, the source of British railway sleepers. About 4,000,000 were required annually. The forests were so much exhausted that now the peasants had to draw the timber as much as twenty miles in sleighs to the rivers. Computing from various authorities, the supply of timber in Canada amounted to just enough to meet the demands of United States factories for eight years. The paper industry of the United States alone consumed 300,000 acres of forest yearly. Railway sleepers in the United States consumed 600,000 acres of forest annually. Mr. Miller spoke extensively of the remedies available, placing most reliance upon systematic replanting.

Prices Easier on the Prairies.

Prices at Edmonton are reported to have fallen about \$2 per thousand and on spruce and \$1 per thousand on a few lines of imported lumber. The reduction is from the price which has prevailed since last June. The effect will be a cheapening of building cost and it is expected that building will be stimulated correspondingly. Mill owners are reported to be so pleased with the prospective increase in demand that they are willing to inaugurate a further reduction if the demand warrants it.

The idea has prevailed among British Columbia lumbermen and newspapers lately that the prairie lumbermen were boycotting the western dealers, inasmuch as they had not followed the lead of the westerners and reduced prices. Very little lumber is being purchased at present from British Columbia, but the prairie men deny the combine charge and say they were overstocked with British Columbia lumber, which they bought at higher prices and had to clear off before reducing the price and purchasing more lumber. Moreover, they charge the British Columbia men with selling their stocks to prairie dealers and then reducing prices without any warning, thereby causing a loss to the prairie dealers. The present reduction by the prairie dealers will make matters more pleasant all round.

The Lillooet Lumber Company, Limited, of Port Haney, B.C., has recently changed hands, the purchasers being Mr. Wm. Holden and M. L. Proctor, both of Vancouver. The concern will hereafter be known as the Holden & Proctor Company, the head office being one Homer street, Vancouver. Mr. Proctor will be the manager of the mill, which is a plant of 35,000 feet per day capacity, about four miles from Port Haney, on the Lillooet river. Mr. Holden is a prominent real estate man in Vancouver, and Mr. Proctor has been a lumber man practically all his life, having been, until about a year ago, associated with Mr. Alex. McDougall, in the ownership of the Fernie Lumber Company, at Fernie, B.C.

German Method of Treating Pulp.

The German method of preparing beaten stuff—pulp and rag—for paper, is referred to by Carl Eichorn, a German builder of beating engines, in "Papierfabrikant." The first condition for obtaining wet stuff, he says, is the proper ratio between the number of knives on the roll and the number of knives in the bed plate. The old-fashioned beaters of small capacity had very light rolls, in fact when dense masses of fibre came under the roll the latter used to jump up. These light rolls, even when hard down, used to give wet beaten rag stuff of very strong quality, because the pressure per square inch of bed plate was only small, whereas a modern heavy roll working on the same or only slightly larger bed plate would tend to cut the fibre into small fragments. The work of the beater roll is not entirely expressed by the number of knife strokes per revolution; a roll with sixty knives on a bed plate of fifteen knives would give 900 strokes per revolution, so would a roll with 900 knives on a bed plate with the knife, but the effects would be very different. In the latter case every fibre would be drawn between the knives end on, and every stroke would be a cutting stroke.

With a broad bed plate with several knives the fibres take a complicated path across the bed plate, being thrown slantwise and crosswise, and receive the strokes in every conceivable direction. For wet beating, the bed plate must be much broader than usual, and with a heavy roll the bed plate should contain at least thirty-five to forty knives. If then the knives of the roll be broad, the pressure per square inch of bed plate may still be as low as in the case of the old-fashioned beaters, and it will be impossible to beat the stuff "dead" even when the roll is down. But however favorable the design of the beater, wet stuff can only be got by loading it in a very concentrated state. For this class of work rapid travel of the stuff is not desirable, and with Eichorn's patent circular the pulp still has a sufficient travel even at 20 per cent. concentration. In the writer's opinion stone beater rolls are not suitable for the wet beating of rag pulps. For the preparation of wet beaten sulphite pulps for grease proof papers, the details of construction as regards the ratio of the number of knives on roll and bed plate are somewhat different from those required for rag pulps. The general principle is, however, the same, broad knives on the roll working on a comparatively large number of broad knives on the bed plate. A certain "lashing" action on the pulp is necessary in addition to the beating, and the travel is so slow as to be scarcely perceptible.

Excelsior Information Wanted.

A new Ontario subscriber writes to us as follows:—In your issue of March 1st. under the heading "British Columbia Forests" I notice that poplar is said to be highly adapted for excelsior packing. As there is considerable poplar in the vicinity in which I reside, since seeing this in your paper, I am thinking seriously of going into the excelsior business. As I have no practical knowledge of the business, I would consider it a favor, if some of your subscribers would, through the columns of your valuable paper, describe the business from stump to finished article; that is, mode of handling stock, machinery used, and the market price of the finished article, especially in the Toronto markets.

A large plant for the manufacture of special lines of woodworking machinery is soon to be started in Seattle, Wash. The promoters of this are: Messrs. Geo. W. Stetson, of the Stetson Post Mill Company, Seattle; Frank W. Stetson, Seattle; and H. B. Ross, late vice-president and general designer of the Berlin Machine Works, Beloit, Wis. A site has been secured on First avenue south, and it is estimated that the works will employ 200 men. Operations are expected to commence in a few months.

The Columbia Blower Company have installed a complete blower system at the Saanich Lumber Company's mill at Sydney, Vancouver Island. The equipment included a 70 inch Sturtevant fan. They have also installed a new separator at the Brunette Saw Mills at Sapperton, B.C.

Huge Pulp Mills in B.C.

Much interest is being manifested in the enterprise of the British Canadian Wood Pulp and Paper Company, Limited, who are preparing for the erection of a mammoth plant at the entrance of Rainy River on Howe Sound, 25 miles from Vancouver.

The plant is to have a weekly capacity of 180 tons of news paper and 270 tons of wrapping paper. The plan of the company is to erect the pulp mill, which is to have a capacity of 420 tons of wood pulp per week, before the completion of the paper mill division. This will enable the company to enjoy the profit from the sale of pulp while the mill is under course of construction. It is proposed to have the pulp mill in operation by November 1, 1908. Arrangements are being made to have the digesters, beaters and other heavy machinery built in Vancouver instead of importing it from the United States. Mr. Chas. B. Pride, of Appelton, Wis., who has been engaged as architect and engineer, is regarded as one of the best authorities in the United States and Canada on the erection of pulp and paper mills, having built more than 50 of the leading mills of Wisconsin, Michigan and Minnesota during the last 25 years. According to Mr. Pride there will be no difficulty in building the majority of the heavy machinery in the local shops. The decision of the company to build the machinery there, means a great deal for Vancouver, as the digesters, beaters, washers, pumps, etc., alone represent an expense of approximately \$50,000. Mr. Pride is to be assisted in the erection of the mill by Col. T. H. Tracy, former city engineer of Vancouver, and Mr. J. C. W. Stanley. The company has also been granted the water rights on Rainy River, which, according to the special reports of Col. T. H. Tracy, is capable of developing from 2,000 to 5,000 horse-power. This will enable the company to install a series of mechanical grinders for the manufacture of ground wood, which is used to supplement chemical fibre in the manufacture of paper. The refuse material from the saw and shingle mills is to be conveyed in specially prepared scows to the plant, where it is disintegrated into suitable fineness for conversion into wood pulp. This will relieve the company of the expense incident to the use of uniform cut wood, which is the only method now in general use throughout Eastern Canada and the United States. One of the innovations of the new company is also a patented process whereby they are able to use Douglas fir and other resinous woods in the manufacture of wood pulp. Paper makers in the past have never been able to use woods containing pitch, resin and essential oils; by the new process all these parts are passed off in solution and the fibre recovered by subjecting the mass through a system of pressing.

The company is capitalized at \$1,000,000, and is now placing the preferred stock of the corporation on the market. Those prominently identified with the company are:—

Capt. H. A. Mellon, Mellon & Scott; Francis J. P. Gibson, British Columbia Trust Corporation; W. H. R. Collister, manager, Albion Iron Works; Fred Smith, of the Wholesale Paper Company, of Smith, Wright & Davidson, and many other well known Vancouver men.

The company now has in operation at its general office, 313 Cordova street, Vancouver, a complete miniature plant for the manufacture of pulp and paper, which is open to the public for inspection. The complete plant will cost approximately \$600,000, and means a great addition to the future welfare of Western Canada.

East Templeton Company to Sell.

The timber limits, real estate, saw mill, mining lots, plant, supplies and logs in transit of the East Templeton Lumber Company, Que., will be put up for sale by auction on Tuesday, September 15, at 2.30 p.m., at the Russell House, Ottawa. The limits include those at Coulonge, Gati-neau, Wakefield and the Black and Dumoine rivers. The mining lots are in the townships of Wakefield, Buckingham, Portland East, Portland West and Derry. The real estate, saw mill, lumber yard and wharf are at East Templeton, Que. Full particulars are to be obtained from the vendors or their solicitors, Messrs. Gormully, Orde & Powell, 33 Sparks street, Ottawa.

Fortunes in Precious Woods.

"Fortunes in precious woods," sounds a little strange perhaps, but it is the title of an interesting article in the Philadelphia National Coopers' Journal. In this country wood is so common, it says, that the term "precious" hardly seems applicable to any native species, and yet a single log of American walnut, 6 feet long, when recently cut up into veneers brought \$525, and another, only slightly larger sold for \$600. The dealers in precious woods in New York employ experts to travel through the woods on the slopes of the Blue Ridge and Cumberland mountains to inspect and purchase the finest specimens of American walnut. All of these trees are cut up into veneers and sold at 20 cents and more a foot.

The demand for precious woods is increasing. They come from all parts of the world. North America produces figured walnut, figured birch, bird's-eye maple, curly ash, and quartered oak. All of these have been made extremely valuable by the veneer machine. This machine cuts a log into slices ranging from 1-16 to 3-8 of an inch in thickness. The veneers are placed in cases or flitches, 500 sheets to each one, and sold to furniture makers, piano manufacturers, and cabinet experts at prices ranging from \$300 to \$2,000. A log of fancy wood worth \$50 in the rough before the veneer machine was invented would bring today five to ten times that sum. Some woods are so precious that they sell by the pound instead of by board measurement. French burl brings from 15 cents a pound up, and a single log has sold in New York for \$2,500.

A more expensive wood than the French burl is a rare wood that comes from the coast of Africa, and is commonly known as amboy. This frequently sells at from 20 to 28 cents a pound. It is a reddish brown wood, irregularly veined, and is held in high esteem for inlaying. Even ebony is sold by weight, commanding something like \$70 a ton. Fortunately lignum vitae is not thus disposed of by weight. This is the heaviest as well as the toughest wood known to the trade; it will out-last brass, and is tougher than many grades of steel.

The rarest of all the precious woods is said to be the calamander, a tree which grows on the island of Ceylon, where it is held in reverent awe. At one time the trees were quite plentiful there; but only about 90 specimens remain, and all these are numbered and jealously guarded by the government.

For upward of three hundred years the East Indian Government has had a monopoly of the sandalwood trade, and the supply is so restricted that enormous profits are realized to the stockholders. Sandalwood is deliciously fragrant, and cuts beautifully.

Circassian walnut, cut on the shores of the Black Sea, is a precious wood that sells at 15 cents and more a pound. It is employed extensively in veneering and inlaying, and when polished is marked by striking lines of black and dark brown.

Rosewood from Bahia, white mahogany from the west coast of Mexico, and satinwood from Santo Domingo are other precious woods that are cut into thin veneers and sold by the foot or pound. Cocobolo and grandadilla are woods much in demand for making knife handles. Spanish cedar is still an important wood in the trade, and also snakewood, which is valuable because of its peculiar markings. Turkish boxwood is popular for wood engraving; but ararilla is the best for fine artistic work. It is a rare and beautiful wood, with many special marks of excellence.

For Free Pulp Wood.

The charge was recently made on the floor of the House, at Washington, by Mr. Hitchcock of Nebraska, that the Committee on Ways and Means has been a party, either knowingly or in ignorance, "to gigantic schemes of plunder."

Mr. Hitchcock was speaking on the tariff question, with special reference to the duty on wood pulp. The real object of those who secured the Dingley tariff paper, he declared, was to capitalize the water-power and spruce forests of the United States, form a great monopoly and raise the price of print paper in America.

Another combination, he said, had grown up in the Western States, operating side by side with the International Paper Company. This combination, he said, was composed of mills in Wisconsin, Minnesota and Michigan, "protected from competition by the International Paper Company by reciprocal agreements and protected from competition with each other by mutual understanding."

Probably the best way to clean and renew old files is to sell them

THE WOODWORKER

The Hickory Handle Industry.

Among the industries that have shown progress recently that of hickory handle manufacturing is notable, says a New York exchange. While it cannot be said that there has been any remarkable increase in this line, there has been enough to make manufacturers feel the encouraging effects of the change.

The stocks of manufactured handles in the warehouses of manufacturers have been reduced to a considerable extent lately, and as the season is nearly at hand when the handling of hickory stock is more costly than at other times, it is generally believed that prices will be at a fair margin. It would be well for many of the manufacturers to bear this in mind, and to hold up prices instead of cutting them at a season when the cost of material and production will be much increased.

Some handle manufacturers apparently forget what it costs to manufacture a handle, and see only the returns without noting the expense incurred in production. In the event that handles are graded at this time, as they should, and prices remain where they are now, the percentage of profit for the manufacturer would be simply nothing.

This in a great many cases applies to the smaller manufacturer, who apparently loses sight of so many important considerations when he figures on the cost of producing his stock. Hickory is not any less expensive than it was, and with labor at about the same figure and the freight rates actually higher than they were a year ago, what can the manufacturer of handles expect as a result of his indiscriminate price-cutting?

These are the cold facts that the hickory handle manufacturer has to face to-day. If he ignores them he must look for failure sooner or later, because a manufacturer can not long do business at a loss and keep the wolf from the factory door. Every manufacturer, large and small, should take these considerations to heart. The more carefully he studies them the nearer will he be toward the solution of the problem of making his investment pay him a profit at the end of the year.

Where will we get our Match-wood.

The civilized nations of the world strike 3,000,000 matches every minute. Nearly one-half of these are ignited in this country. Americans use up the enormous total of 700,000,000 a year, and have a larger match bill than any other nation in the world.

It might be supposed that because matches are small the makers of them would utilize scraps and left-overs. This is never the case; matches are not by-products. The match machine takes the finest timber, and what it rejects goes to the by-product yard, and the by-product of the match business becomes the largest end, so far as bulk is concerned. Among the products turned out by one factory are 1,000 doors and 800 sashes daily.

As a matter of fact, it would be impossible to carry on the match business at all, at present prices, if the rejected lumber were not worked into something else. The room where matches are made is frequently the smallest department of a match factory. The larger portion contains the saw mills and planing mills, where doors, sash, shingles, lath, siding, posts, cordwood, and many other saleable commodities are made ready for market. The most suitable match timber is pine, linden, aspen, white cedar, poplar, birch, and willow. Others, however, are occasionally used.

In the United States, as well as in Canada, a diligent search for choice forests is maintained, and very large tracts have been bought by companies in the match business, not only to meet present demands, but to provide for years to come. In a single year one match company cut 225,000,000 board feet of pine in the lake region. The cut, however, in that region was exceptionally large in order to save the timber, which was at that time threatened by the ravages of a bark beetle. There are more than 150 match manufacturers in the United States, and about half that number in Canada.

In common with other industries of the United States depending upon existing forests, the match-makers are within sight of a shortage in the wood supply. When present timber holdings have been depleted, they cannot be duplicated. If forced to economize people might get along with fewer than 25 or 30 matches a day each, as at present, but they will probably insist on having them, and will demand, as in Germany and France, that foresters plant and grow timber especially for matches. This could readily be done if forests were placed under management and were no longer left to run wild and produce cordwood and brush when they ought to grow merchantable timber.

The McClurey Basket Company of Canada, Limited, has been incorporated at Toronto with a capitalization of \$100,000.

THE SHIMER CUTTER HEAD.

Hardwood Flooring.

The use of hard woods in house-finishing and other lines has been constantly growing until now nearly every section of the country is contributing some wood of a hard and tough nature for this purpose. The fact that these woods take a handsome natural finish, and are more serviceable, especially for flooring, has rooted them so firmly in popular demand that they are not liable to ever go out of use. How to work them economically with the tools at hand has, however, been a serious problem with the woodworker who desires to turn out good work at a fair margin of profit.

To meet this demand a Shimer Cutter Head has been brought out, which in the most severe trials has "made good," both as to the quality of work and the amount turned out. It is known as the Shimer Intermediate Cutter Head. In its general make-up it resembles the regular Shimer Heads and it is provided with the same reliable expansion feature, but in regard to the cutters and their fixtures it is entirely new.

By means of this tool straight and circular bits are used in combination. The straight bits used for cutting the vertical edge of the board are made from flat steel usually of easy access. The square offsets above and below the tongue are formed by grooving out the end of the knife and projecting it to the proper distance. The neat finish is accomplished by means of the intermediate circular bits, working in pairs in upper and lower series, in combination with the straight ones, to complete the full outline.

The setting of the bits in pairs, on opposite sides of the Head, and the symmetrical construction of this new tool, insure a perfect running balance, a feature of much importance and one appreciated by the woodworker who is accustomed to using fast running tools.

As all the good points of a tool like this cannot be mentioned in a short notice, readers should send for a descriptive circular of the intermediate head. Like other Shimer Heads, these tools can be had on trial by responsible lumbermen anywhere by writing to Samuel J. Shimer & Sons, the manufacturers, Milton, Pa.

Waste materials present a problem which the woodworker frequently has to study. A correspondent of The Indianapolis Woodworker has the following to say on the subject: Chief among the many forms of waste in these plants is the lack of co-operation in the working force, although the waste of time, material and abuse of machinery and equipment form large items. How much more profitable and agreeable it would be if we practised the golden rule, from the superintendent down to the sweeper, and "do unto others as we would like to be done by," instead of trying to "do" each other, as seems to be the case in many shops. What good can one do going around a shop every chance he gets, telling some one of the mistakes of others and talking about his brother workmen behind their backs? An old and very true saying is, "A dog which will bring a bone will carry a bone," so every time I hear one of those tales I try hard to look out for my bones, that none shall be carried away.

It is reported that a plan for an attractive United States forestry building is being worked out for the Alaska-Yukon-Pacific exposition, which will be one that lumbermen may be proud of.

HUTHER BROTHERS FACTORY, ROCHESTER, N.Y.

A Model Saw and Cutter Plant.

Rochester, N.Y., is well-known for the excellence and superior quality of the product of its mills and factories. Especially is this true of the saws and cutters manufactured by Huther Bros. Saw Manufacturing Company, established in 1880 and incorporated in 1906. This company manufacture a full and extensive line of circular, band and milling saws, and makes a specialty of patent dados or grooving saws, lock corner box cutters, box board matcher cutters, smooth cutting circular mitre saws and a superior quality of band saws. These saws are manufactured under the supervision of experts, by skilled workmen who have at their command modern tools, a new and commodious plant and the highest quality of special grades of steel, selected after years of experimenting for its toughness and hardening qualities. They are made from the highest quality of circular saw steel and finished as nearly perfect as it is possible to make them. Every saw is guaranteed to have an even and tough temper, to be true and straight, to be ground accurately to the thousandth part of an inch and to be finished in the best possible style.

The Huther Bros. patent grooving or dado head is no longer in the experimental stage of its existence. It is being used in nearly all of the furniture factories, box factories, sash, door and blind factories, wagon factories, and in fact in all kinds of woodworking plants and planing mills. It consists of two outside cutters or saw 1-8 inch thick, which have ground sections, giving them the combined advantage of a knife

changing the saw. The lock corner box cutters are made with from two to eight teeth, and from 1-16 inch to 3-8 inch thick, in various diameters. The backs of the teeth are "backed off" or ground away to eliminate all friction. The patent grinding on these saws insures a well-fitting corner, which goes a long way towards making a perfect box or drawer.

For the cooperage trade are made all kinds of concave and chamfering saws, both for loose and tight barrel work. Concave saws as large as 16 inches in diameter, and chamfering saws as thick as 2 inches, are made for cutting heading for tight barrel work. The band saws made by this company are manufactured from the highest grade of imported steel, joined and filed ready to do good work. Only experts are employed to tension the wide saws. Aside from the above mentioned saws, the company make a full line of edger saws, planer and sticker knives, circular knives and milling saws, also special saws for panel raising, beading, cutting and grooving metal, etc. Their plant and offices are located at 1190 University avenue, Rochester, N.Y.

Savings from the Waste Pile.

There are two main points to be considered in the making of any ordinary article from wood. One is the cost of the material and manufacture, the other is the selling of the article. Too many mechanical men give but little regard to the value of, and the necessity for, what is termed salesmanship as an essential factor in connection with the manufacture of various articles. One important feature is the finding out of where a good market can be had for anything one contemplates manufacturing.

Every once in a while we hear of some user of wooden material who is anxious to find stuff which the manufacturer frequently throws in the waste pile. There were developed lately several instances of this in connection with the narrow widths in veneers, and there are unquestionably many instances that can be related in connection with the use of almost any dimensions of wood. It is not likely that there is a very urgent demand at the present time for anything, because the general business depression has left the country temporarily well supplied with raw material, yet it is well to look after these things for the sake of the future; and notwithstanding the experiences of the past, some of which have been related by disappointed people, the fact remains that the future will see plenty of demand and a rise in prices for small pieces of wood that formerly went into the waste pile. It is not meant by this that any man will pay the price, but there are people in the country who have paid, and who will have to pay again in the future to get their wants supplied for small dimension stock. It is a question of finding the right people, then cutting the dimensions to fit their needs.—*"The Woodworker"*

Mr. James Hamilton, the well-known carriage wheel manufacturer of Lindsay, died suddenly last week after a brief illness of only one day. He had been afflicted with heart trouble and death was due to a sudden and severe attack. Deceased was 65 years old, and leaves a widow, two sons and two daughters. The funeral took place on Tuesday of last week to Peterboro'.

Statistics show that the United Kingdom has a smaller percentage of woods to other land and a smaller area of woodland per capita of the population than any other country in Europe. It has absolutely less woodland in acres than any other European country except Belgium, Holland, Denmark and Portugal. The statistics count Turkey, Bulgaria, Bosnia, and Herzegovina as one with five times Britain's woodland acreage, but give all other countries separately.

HUTHER PATENT MATCHER

and saw—the knife for smooth work and saw for fast cutting. Between these two outside saws are placed two-tooth inside cutters to fill out the width of groove to be cut. These cutters are made 1-16 inch, 1-8 inch and 1-14 inch thick, and are swaged to overlap. By this means the bottom of the groove can be made smooth without ridges or splinters. This head will cut any width of groove from 1-8 inch to 2 inches or over, divisible by sixteenths, either with or across the grain.

The patent matcher cutters are no more or less than one of the many specially designed outside saws. On the cutters made for cutting the tongues the bevel sections are all ground on one side, and for cutting the groove the regular patent groover is used. Sets are arranged to do single, also double or triple matching, the stock being resawed after it is matched. These heads are also made concave for candy pail or other work where circular grooves are desired. Besides these cutters, the firm make a great many other groovers designed for special and smooth work.

The smooth cutting circular mitre saws have a great advantage over the regular saws, inasmuch as they are hollow ground to run without set, and filed ready to use, with a good deep beveled tooth, which insures a smooth cut. They are made with all cross-cut teeth, all rip teeth or with a combination tooth, to be used for cutting a mitre or where a little of both ripping or cross cutting is done on the same machine without

Moose Jaw Dealers Inactive.

W. W. Davidson, lumber dealer of Moose Jaw, Sask., speaking of present conditions recently, said: "Lumber dealers down our way were hard hit by the partial failure of crops last fall. It is a safe calculation that at least 60 per cent. of their sales still remain unpaid by the farmers. Apply this condition to every town on the prairie and it will be evident that these obligations in the aggregate represent an enormous sum, easily over \$1,000,000. A reduction averaging 15 per cent. has been made in the price of rough lumber, which now sells at about \$28 to \$29 a thousand. These figures look large, but the margin of profit is limited. As far as I can make out the initial cost of getting out the logs is very high. To that must be added the cost of manufacture, profit to the millmen and the railway rates. But in any event the newcomer must have lumber. That is why I say the dullness is only temporary, as settlers are piling into the vast territory east of the mountains and all must build."

There are about 200 professional timber cruisers in British Columbia at present. All were busy during the season when the demand for timber was at its height, but now few of them can get anything to do. The dull lumber season and the placing of the reserve on Government timber has made, what was last year a profitable calling, a rather perilous one to follow.

Inspecting Hand Loggers' Work.

Agents of the British Columbia Timber Department have been engaged during April in making a thorough canvass of the coast region as far north as Broughton Island in order to see that handloggers are complying with the regulations.

Many handloggers' licenses are expiring, and as they are not renewable the department officers have instructions to see that operations are not continued beyond the time limit of the licenses. Every inlet between Vancouver and the northern end of Vancouver Island is to be visited and the inspection will occupy some time. As handlogging licenses expire dozens of men now engaged in pulling timber off hillsides close to the water's edge will be forced to engage in other employment.

The Government has not yet perfected plans for the system of fire patrol and protection which it will carry out during the coming summer, but a general scheme is not being outlined. The appointment of a fire warden and a number of deputies is expected as soon as definite plans have been made.

Drivers Busy in Saskatchewan.

The lumber jacks left Prince Albert early in April for the head waters of the Shell, Sturgeon and Red rivers, where the logs cut during the winter are piled on the dump waiting for the spring freshets to carry them 100 miles to the mills at Prince Albert. There are some fifty million feet of logs stored along these rivers in the far north and the work of bringing them down is the most unpleasant part of the lumber jack's life. The rivers have been dammed at different points and a flood is stored each spring. By the use of these dams it is not necessary to bring all the logs down on the spring freshet. Part are brought down and the rest are floated to the Saskatchewan river later. The water behind the dam is used for this purpose. As the rivers, though long, are not very wide, running of the logs takes some time. The drive will start in a few days now and for two months the river drivers will be at work, often waist deep in the water. The work is cold and disagreeable and the river drivers receive the highest wages paid to the lumber jacks.

U. S. View of Recent B.C. Legislation.

Canadian methods in administering forests are discussed by the Mississippi Valley Lumberman in a recent issue. It says: "Whatever policy may develop and has already developed in the management of this country, it must be conceded that Canada is ahead of the United States in plans for the conservation of the remaining forest wealth. The Canadian Government took early opportunity to possess itself of the forests within its boundaries. Although this movement has come within comparatively recent years, it must be remembered that the exploitation of the Canadian forests, and particularly those of the West, is behind that of the forests of the west and middle west on this side of the line. For this reason the Dominion and the Provincial Governments have been able to control a larger proportion of the timbered lands. In this connection attention is especially directed to the manner in which both the Crown lands and the Provincial lands of British Columbia are being handled by Government authority. In the United States the Government, through the Forest Service, has control over the timber on the forest reserves, and until recently, the President had authority to create new reserves without action by Congress. But the larger part of the timbered areas of this country had already passed to private ownership, and for the most part, the private owners were intent on cutting the timber as rapidly as possible, with no plans for renewing the growth. The title of these lands has absolutely passed from the Government.

"The Canadian method differs from this. Such a comparatively

small part of the timber land is not owned by the Government that laws can be applied more effectually, and the tedious and often vain efforts at legislation are avoided by a system that makes it possible for the Provincial Governments to make or change regulations without the slow process of appeal to the legislative bodies. Recent events in British Columbia point out the advantages of this system.

"For instance, toward the end of last year it became evident to the authorities of that Province that the amount of timber remaining under Provincial control was rapidly being reduced by the issuance of licenses. Had these licenses been issued to bona fide manufacturers, who intended to enter immediately upon the manufacture of the timber, the Provincial Government might not have taken the measures adopted the last of the year. But it became evident that many of these licenses were being secured by speculators. Then the Government issued a decree that after December 23 no more licenses would be issued. This was a wise move from more than one point of view. It shut off the speculative trading in Provincial timber, and it reserved the remaining timber until such time as the Government might again be in need of revenue from its timber.

"A later regulation has not been received with favor. Early last month, the Dominion Government issued an order requiring all holders of Dominion timber lands to cut at least one hundred thousand feet annually from each square mile. To eliminate the necessity of building a mill where it is not convenient to do so, the Government will permit the logs to be sold to another mill. This new provision will undoubtedly work a hardship on many timber owners. In many instances, the timber limits have been secured on long time permits for the cutting of timber. They are far from available mills, and many of the owners would have to go to enormous expense to provide facilities for getting the timber out. In other cases individuals or companies control limits that are several miles apart, and the expense of cutting the required amount on each square mile would be prohibitive. The Government gives these holders the option of giving up their timber, but as many of these limits contain timber of great value, it hits the license holders rather hard, even though the Government offers to sell such limits to the highest bidder.

"Another recent provision which, by the way, is less acceptable to the manufacturers on this side of the line, than to those in British Columbia, is the permission given by the Provincial Government to export logs up to a certain amount. Some time ago the Government issued a prohibitive order because the timber of the province was going too rapidly to the mills of the State of Washington. Now the British Columbia log market has become glutted, and as a relief measure the loggers were given permission to sell eighty million feet across the line.

"The advantages of the Canadian system, however, lie in the fact that it is not necessary to wait for legislative action to change the timber regulations. The Government authorities have the power to suspend or change the rulings to conform to varying conditions in the markets. In this country if a body of manufacturers get together and agree to curtail their output because the market has become glutted, their action is looked upon with suspicion, even if the anti-trust law is not invoked to prevent such action. In British Columbia the Government recognizes an unhealthy market condition and issues orders to stop the putting on the market of additional timber limits, or suspends an export law to relieve the pressure."

Trouble about Log Jams.

A report from Grand Forks says: Every year the big log jams of the Yale-Columbia Lumber Company cause damage to bridges and property along the Kettle river at Grand Forks, and this spring the property owners are up in arms at the manner in which the big lumber company has left the logs and drift wood in the river. A written protest against the condition in which this company has left the Kettle river opposite the south end of First street is being numerously signed. It is the intention to present the protest to the local government agent with the view of having the government take some action to compel the lumber company to remove the obstructions from the river. It is the general impression that the late cold spring will cause a freshet, and that much damage will be done to property unless the logs of the lumber company are removed from the river.

U.S. Retaliates on St. John River.

A Washington despatch announces that a bill has been introduced in the United States Senate to settle lumber boundary conflicts on the St. John river, and providing for repeal of the law permitting free entry of American cut and owned lumber from St. John into the United States. This year, Hon. Mr. Pugsley introduced in the House of Commons a bill to prevent any boom being attached to the Canadian bank, except under license by the Government of Canada. It is believed that the bill proposed at Washington is meant as retaliation for the proposed Canadian act. It is also held that the bill will not settle the boundary conflicts, but will affect only the mill owners in St. John.

The Warren Ross Lumber Company, of Jamestown, N.Y., has purchased the business of the home office of the Ross Lumber Company, Jamestown, N.Y.

Old Fashioned Stubbornness.

"Old Fashioned Stubbornness" is the subject of an article in the Indianapolis Woodworker. A good example, it says, is found about the cut-off saws where the stock sawyer works. With all the conveniences offered by the modern automatic and semi-automatic stop gauges for cut-off saw benches, we find many sawyers wasting a lot of time using pieces of 2 x 4, 1 x 6 and various other sticks of lumber for stock gauges, which have to be piled up and handled every time, and set on the table loosely, resting against some permanent stop at one end. It is rather difficult to understand why people will persist in using these clumsy appliances and wasting both time and energy, when a very small outlay would pro-

vide good modern stop gauges. Sometimes a man will defend his action by saying he gets a more rigid stop with his old-fashioned method, and that some of the new-fangled stop gauges have a little "give" and are a little too uncertain for exact cutting. This charge may do very well against some of them, or against the manner in which they are put up, but there must certainly be a goodly number of stop gauges that are thoroughly reliable as to rigidity. It looks as though when we grow a little old we become creatures of habit, confirmed habit, in regard to the things we use, and thereby unconsciously become unfriendly enough to new innovations to generate an ailment that cannot well be classed by any other name than old-fashioned stubbornness.

AUCTION SALE

— OF —

**VALUABLE TIMBER LIMITS,
SAW MILL,**

Plant, Supplies, Mining Lots, Logs, &c.

— OF —

**THE EAST TEMPLETON LUMBER
COMPANY, LIMITED.**

There will be sold by Public Auction, at the Russell
House, in the City of Ottawa, on Tuesday, the 15th
day of September, A.D. 1908, at 2.30 o'clock p.m., by
THE EAST TEMPLETON LUMBER COM-
PANY, LIMITED, the following Timber Limits,
Real Estates, Saw Mill, Mining Lots, Plants, Sup-
plies and Logs in transit, namely:—

Parcel Number 1. "Coulange Limits," com-
prising 156 square miles of Timber Limits on the
Coulange River in the Province of Quebec, covered
by Licenses Numbers 149, 150, 151 and 152 of Season
1873-74 and known as Berths W, X, Y and Z, together
with certain Limit Plant, Supplies and Live Stock to
be sold therewith.

Parcel Number 2. "Hibou Limit (Gatineau),"
comprising 20 square miles of Timber Limit on Hibou
and Ignace Creeks covered by part of License No.
550 of Season 1873-74, together with certain Limit
Plant and Supplies to be sold therewith.

Parcel Number 3. "Wakefield Limit (Gatineau),"
comprising 8 square miles of Timber Limit
in the Township of Wakefield covered by License
No. 58 of Season 1873-74.

Parcel Number 4. Several Freehold Timber Lots
in the Township of Wakefield.

**Parcel Number 5. "Black and Dumoine Riv-
ers Limit,"** comprising 26½ square miles of Timber
Limit on the Black and Dumoine Rivers covered by
part of Licenses Number 362 and 369 of Season 1873-
74 together with certain Limit Plant and Supplies
therewith.

**Parcel Number 6. Real Estate, Saw Mill, Lum-
ber Yard and Wharf at East Templeton.** This
parcel consists of about 298 acres more or less of
Freehold and 5 acres of Leasehold land at East
Templeton, P.Q. (about 8 miles below Ottawa on the
Ottawa River), together with a fully equipped Saw
Mill and Machinery erected thereon having a cap-
acity of 150,000 feet per day, with Lumber yard,
Wharf, Railway siding, Cars and other plant and
machinery therewith.

Parcel Number 7. Mining Lots. This parcel
consists of several mining lots and mining rights in
the Townships of Wakefield, Buckingham, Portland
East, Portland West and Derry.

Parcel Number 8. A large quantity of logs, tim-
ber, telegraph poles and ties now lying in and about
the Ottawa, Coulange and Gatineau Rivers at and
in transit to the above mentioned Saw Mill.

The first seven parcels above mentioned will first
be offered for sale en bloc, subject to a reserved bid
fixed by the Vendors. If the reserved bid is not
reached, then each parcel will be immediately offered
or sale, separately, subject to a reserved bid fixed
by the Vendors.

Full particulars and complete descriptions of the
respective parcels and the terms and conditions of
sale will be made known at the time of sale and may
be seen on application to the Vendors at East Tem-
pleton, P.Q., or to their Solicitors, Messrs. Gormully,
Orde & Powell, No. 33 Sparks Street, Ottawa

THE EAST TEMPLETON LUMBER COM-
PANY, LIMITED,
Vendors.

Dated this 3rd day of March, 1908.

ting of lumber by the thousand in any quantity
from one million to one hundred million feet.

SOUTH RIVER LUMBER COMPANY, Limited
South River, Ont. 10

B. C. TIMBER AND TIMBER LANDS.

I HAVE FOR SALE, SOME OF THE FINEST
tracts of Timber in British Columbia, principally
Spruce, Fir and Cedar, ranging from 2,000 to 140-
000 acres, mostly on tide water, and easily logged.
Prices from \$1.00 to \$9.00 per acre. State your
wants: I will supply them. W. H. LEMKE, P.O.
Box 972, Vancouver, B.C. 9

Light Cut in Dauphin District.

Lumbermen in the Dauphin,
Manitoba, district are reported to
have taken out 50,000,000 feet of
logs last winter. This is about 25-
000,000 feet less than the previous
season's output. The cut, how-
ever, with what lumber was un-
used from the previous season, will
supply the demand without diffi-
culty. Many ties were taken out
for railway construction. The
Cowan Construction Company and
and Mutchenbacker Bros. were
the largest operators in this line,
the former having taken out 750-
000 and the latter 50,000 ties. Fol-
lowing is a summary of the cuts
taken out by the leading operators
in the Dauphin district: Red Deer
Lumber Company, Red Deer, 8-
000,000 feet; T. A. Burrows, Duck
Mountain, 5,000,000; Shaw Bros.,
Prairie River, 4,000,000; Sas-
katchewan Lumber Company,
Crooked River, 3,000,000 Dart
Lumber Company, Erwood, 3,000-
000; Cowan Construction Com-
pany, Mistatam, 3,000,000; Mutch-
enbacker Bros., Mafeking, 2,000-
000; Ruby Lake Lumber Company,
Etoimami, 2,000,000; McCutcheon
Lumber Company, Minitonas, 1-
000,000; J. Sinnott, Duck Moun-
tain, 500,000; J. Hanbury, Duck
Mountain, 500,000; Thomas Har-
per & Sons, Duck Mountain, 500-
000; portable mills, 1,000,000.

**Revival Due in British
Columbia.**

Mr. F. W. Peters, of Winnipeg,
assistant to Mr. Wm. Whyte, sec-
ond vice-president of the C. P. R.,
predicts a revival of the British
Columbia lumber industry owing
to the enormous influx of settlers
into Manitoba and the new pro-
vinces. In an interview with the
Vancouver Province he said: "No
revision of freight tariffs as affect-
ing coast merchants is under con-
sideration at present. The adjust-
ment of freight rates made by the
C. P. R. last fall seems to have
given entire satisfaction, as we have
not since received any complaints
from the coast.

"There is every likelihood of an
early revival in the Western lum-
ber industry, owing to the enor-
mous influx of settlers into Mani-
toba and the new provinces. While
the number of arrivals from Eur-
ope this spring will scarcely equal

that of last year, it is not infre-
quent for over 3,000 people to reach
Winnipeg daily on westbound
trains. The interesting feature of
the home-seeking movement is the
increased immigration from the
United States. The Americans are
pouring in by thousands.

Improvement at Rainy River.

A Rainy River despatch reports
a marked improvement in the lum-
ber industry for April over the
first three months of this year.
During January and February,
lumber shipping at this point was
almost at a standstill. The warm-
er weather of March brought about
a resumption of business to some
extent, and in April conditions at
the mills were again becoming nor-
mal. The lumber industry is the
mainstay of Rainy River and vicin-
ity, and the change for the better
is being felt in the larger volume
of business done by the merchants,
and the brightening up of business
generally.

Electricity for Saw Mills.

The adaptability of electricity as
a motive power for saw mills is
shown in the new tie mill lately
erected by Mr. Routlee in the mu-
nicipality of South Vancouver,
B.C. The transmission lines of
the British Columbia Electric Rail-
way Company, Limited, from the

power station on the North Arm
of Burrard Inlet, to Vancouver,
have been tappe dabout a mile west
of Barnet, B.C., a set of oil-cooled,
step-down transformers having
been set up under cover on the
roadside. From here to the mill,
which is located in the midth of the
timber, a pole line has been secur-
ed by cutting off the tops of con-
venient trees and affixing cross-
arms. On these the 2,000 volt wires
are strung, carrying the electricity
to the mill, which is operated by a
60 horse-power motor. The capa-
city of the plant is a tie per minute.

**New Machinery at Manitoba
Iron Works, Limited.**

The Manitoba Iron Works, Lim-
ited, have completed the installa-
tion of electric motors throughout
their shops, having discarded steam
except for heating purposes. They
have installed approximately 200
horse-power, distributed amongst
twelve motors, and the whole plant
is now operated by electricity pur-
chased from the Winnipeg Street
Railway Company. A fine new
compound duplex intercooler air
compressor, Rand make, has been
installed, and a new Allen riveting
machine and several large air hoists
for the boiler and structural shop,
which, with many minor improve-
ments, have placed this fine plant
in a high state of efficiency for the
season's work. The company have
already booked a large number of
orders for execution this season.

Current Trade Conditions

ONTARIO.

There is not much change to report in the lumber trade in Ontario, although the outlook is somewhat brighter. Preparations are being made on the northern rivers for the annual drive, but as yet the ice has not gone out from the inland lakes, and from some of the rivers. It is expected that the drive will not commence until well into the first week of May. Some of the mills are not going to start till about the 15th of May, as manufacturers are anxious not to overstock the market. It is likely that red pine will be lower in price because of the competition of southern pine. Laths are already down. White pine is expected to stay where it is. In Toronto the building trade is opening up and the lumber trade will likely pick up as a result. Some English buyers who were in the city recently looking into the local conditions, stated that very little should be expected at present, as the market there was very dead. The United States market for Ontario lumber is also quiet and is making the Ontario market flat. Local demand in Ontario is about normal, and reports indicate that commercial paper is being pretty well met. Wages of river drivers are down to \$30 to \$40 a month, whereas they were formerly from \$50 to \$60 a month. This has been brought about by the recent business depression and by the fact that so many men who were employed in winter cutting camps are now idle and available for the drives. Wages at the mills will be down about ten or twenty per cent. In Eastern Ontario reports are that the season will be just about as busy as last. Retail yards are expecting a brisk trade in a short time. Ottawa reports show only a fair number of enquiries from United States points. The local demand is only normal, while sales are few and prices firm. In Western Ontario a

stiffening of prices is expected, particularly for yellow pine, which has been selling at a very low rate recently. If this occurs the market will also be strengthened for hemlock. Manufacturers are still holding back throughout Ontario, and to all appearances do not intend to allow prices to sag. The increase in building operations which has already commenced gives them reason to expect that retailers will soon have to replenish their stocks.

EASTERN CANADA.

Lumbering circles are still dull in Eastern Canada, and until a revival of the demand from United States and British points occurs, or at least some indication of a revival, it does not look as though activity will be at all extensive. Reports from Fredericton indicate that driving operations may commence early in May. In spite of the inactivity of the market, the lumber operators are preparing actively for the drive. On the St. Joseph river, conditions are reported to be all that could be desired, with excellent prospects for a successful drive. Wages for river drivers have fallen off and plenty of men are offering at \$1.75 and \$2 a day. On the Restigouche river and its branches indications are that there will be plenty of water for the drive. Recent snowstorms have added greatly to the reserve.

WESTERN CANADA.

Reports from the West are all encouraging. Building activity is making a demand for lumber. The surplus of logs on the coast, which led the Government to remove the embargo upon their export, has been reduced by about one-half. There is not so great a demand for these logs in the States as was expected, but the local demand, together with the small demand from the States, have both brought about the decrease. A noticeable feature of the British Columbia lumber business is the increased number of

companies from the United States which are commencing operations there. In the northwest an active season is expected. At the Poplar Creek camp there has been a record cut for Alberta of 8,000,000 feet. In the Saskatchewan camps activity is general. Fifty thousand feet of logs have been cut within a hundred miles of Prince Albert. Saw milling companies in Saskatchewan in several instances are reported to be enlarging their mills. The drive will start in a few days and will continue probably for a couple of months.

UNITED STATES.

Chicago markets are reported to be in a dormant state. Fir and spruce are finding strong competition from yellow pine. The only demand of any size is for special stuff. A slightly better enquiry is evident for shingles as a result of building activity. Red cedars have strengthened somewhat, but stocks are still held pretty generally light. The situation in white cedars has not changed, though there is a tendency apparent towards increased firmness. Lath are in better demand, but prices remain unchanged. Lumber is improving at Buffalo, but there is no sign of the old activity as yet. The white pine trade is improving, as the supply is diminishing rapidly. It is not unlikely that before long its price may advance. Hardwood is reported to be in fairly good shape for an early resumption of activity. At North Tonawanda the volume of business is fairly good. The dealers report only a small falling off as compared with last year. Lumbermen appear to be fairly optimistic in regard to the future, and there is unquestionably good ground for maintaining bright hopes. There is no evidence to be had just now of the decline of the Tonawandas as a wholesale white pine market, which has been predicted for a number of years. There is a great amount of capital invested there, and the extent of business transacted would cheer up any pessimist. Dealers believe that the trade now opened will keep up and that a pronounced increase will occur in May. It is expected that

prices will be just as high if not a little higher than they were at the opening of navigation last year. New York markets show, if anything, a slight increase in demand, but it is still too early to state whether prices will undergo any change. The hardwood market continues in fair shape, though buying is only for immediate requirements. The white pine trade shows an increased inquiry, and also an increased number of orders, the latter, however, as mostly confined to mixed cars for quick shipment. Mill work and manufacturing trade is running light on material. Taking the trade generally, however, the belief is expressed that the market is getting stronger, but that buying will continue on a conservative basis for some time to come.

GREAT BRITAIN.

Liverpool reports only a slight activity. The spruce market is still dull, with a downward tendency, resulting from the numerous arrivals. Stocks both in Liverpool and Manchester, however, are slowly dwindling and prices may possibly advance some time in May. Pitch pine timbers are quiet, the stock still being far too heavy. The prices asked for pine deals and boards from Ottawa will probably have to be faced by English consumers. Consumers are still holding off, but it looks as though they will find themselves in an unpleasant position as the season for new importations approaches. The most recent reports received from England are of an encouraging nature, and it begins to look as though English importers have begun to realize the situation. This is the only conclusion to form from the large sales which have recently been effected. There is no reason to suppose that the improvement is only of a temporary nature. Prices are not likely to remain very long at their present low level, and already reports are heard of a movement among shippers and agents to lift the values of some of the favorite dimensions. Manchester reports a quiet business, both in regard to volume and price. One or two firms state that they are very busy.

Lumber That Will Bear Inspection

is the sort we manufacture. If you send us your orders you will secure the genuine unadulterated article. We are in a position to supply anything that is wanted in White or Red Pine. The big factor in selling lumber is the stock and the stock we furnish is right.

We Have On Hand

about 700,000 of 6/4 Good Sides; 2,000,000 feet of 2" Dressing and Better, also 1 x 6, 1 x 8, 1 x 10 and 1 x 12" Mill Run, which we are in a position to ship promptly.

Special bills cut to order on short notice in White Pine and Norway, any length from 10 feet to 60 feet.

Cleveland-Sarnia Saw Mills Company

Sarnia Limited **Ontario**

We make a specialty of Tank Stock and Silo Material, any thickness, width or length.

CAMP DEPARTMENT

Does the Camp Employee Get Fair Play.

Complaints are heard from time to time of the treatment given the men engaged for lumbering camps, bush drives or construction camps. Naturally there will always be some dissatisfied parties in every employment. Whether the lumber camp employee gets all round fair treatment is a question more frequently mooted than many others. The Ottawa Citizen recently published a complaint from a British immigrant, on the subject. A letter was received from him in which he complained of alleged exorbitant deductions made from the men's wages by outside employers of labor, secured in the city. He and some other men, he says, answered an advertisement by a Sussex street employment bureau, in Ottawa, and having paid \$1 as fee and been engaged, were given a contract signed by the agent, which stated that their wages were to be \$1.50 a day with a deduction of \$3.50 a week for board as well as a sum of \$1.15 which had been advanced them as railway fare and was to be kept from their first month's pay. So far everything was clearly defined and explained, but he claims when they reached the camp the timekeeper asked for their contracts for the purpose of taking their names, promising to return them when he had finished with them. He did not do so and when pay day came they were told that the charge for board per week would be \$4.00 and not \$3.50 as set forth in the contract. Naturally the men referred him to the employer who had engaged them in Ottawa and the timekeeper promised that he would draw the attention of the manager to the matter. Nothing more was heard by them with reference to the subject until their time was handed to them at the end of the month when they discovered that in addition to being charged \$4.00 a week for their keep they had also been mulcted 50 cents for doctor's fees besides which, they were obliged to pay a commission of 15 cents to have their checks cashed at the local bank. After this a number of men left, a few remaining at work to the commencement of the following month. These did not remain long and when their time sheets were handed to them on leaving they found that a charge of \$1 had been entered against them on account of doctor's fees. This gave rise to much indignation, which the correspondent expressed.

Enquiries at the employment agency elicited a statement that there was no binding agreement whatever existing between the employers and the agents who supplied them with labor, in regard to the wages to be paid or charges to be deducted monthly.

At one time it was not customary to have a medical man attend the camps regularly. Some objections were made by the men and an arrangement was made to have a camp doctor retained and a specified amount deducted from the men's monthly pay to constitute the doctor's salary. This custom has lately fallen into disuse in some localities.

With reference to the boarding arrangements, it was learned by the "Citizen" that except in a few instances they were generally made by the men themselves or else board was provided as part wages by the employers. The amount paid in cases where the men were called upon to supply their own food depended to a great extent on the locality where the work was being carried out. Another question over which there seems to be some difference is that of train fare. When a man is engaged he is given to understand that should he remain at work the whole of the time that the season of his particular employment covers, his fare is provided gratis. If, however, he should leave before its completion the amount advanced would be taken off his time. This was considered a fair proceeding but it was claimed by men in town that this had not been done and that they were obliged to pay from their first month's wages the cost of their transportation, even though they afterwards remained at work during the whole period of the lumber drive or other occupation in which they might be engaged.

The employment agents claim that if any change is made from the understood wages it is the fault of the bosses in the camps and not of the employment agents.

Lumber operators at Fredericton have been preparing actively for the spring driving operations. The operators from the head of the St. John river include Mr. W. J. Noble, who says that conditions are all that could be desired and that the prospects are excellent. A foot of heavy snow has fallen on the upper St. John this week, and snow is now over three and a half feet deep and so solid that people can walk through the woods without the use of snowshoes. Other operators from the same section state that the prospects for good driving are excellent, but it is not expected that there will be much driving before the first of May. Wages of \$1.75 and \$2.00 per day are offered, with plenty of men available.

Electricity in the Camps.

The Cranbrook "Prospector" says: It is far from extravagant to look for the advent of the Bull River Power Company among the many camps in this district before the end of the year.

This company have constructed a bed for their big flume for nearly two miles. Bulkheads have been built on both sides of Bull river, and the full flow of the river can be turned into the big flume, which will be five feet high and sixteen feet wide. Geo. Henderson, manager of the company, was in Cranbrook recently purchasing a saw mill, which will be shipped to Bull river immediately. Mr. Henderson also purchased a planer. Work on the construction of the flume will commence as soon as the mill is in operation.

When the plant of the Bull River Company is in operation it is expected that electric power will be transmitted to almost every city and town, and to all the mining and lumbering camps in Southeast Kootenay. The capacity of the power plant, it is estimated, will be from eight to ten thousand horse-power.

Plenty of Work in Saskatchewan Camps.

Lumbering circles at Prince Albert, Saskatchewan, are active. Gangs of lumberjacks have been sent north to bring down a drive of 50,000,000 feet of logs which have been cut about 100 miles from that city. The Prince Albert Lumber Company has a cut of 10,000,000 feet on the Shell river from last year's operations and about 35,000,000 feet were taken out during the winter. William Cowan & Company have nearly 25,000,000 feet on the upper reaches of the Sturgeon river. This company proposes enlarging its mill and will cut 30,000,000 feet of lumber this summer. The Sturgeon Lake Lumber Company has finished hauling its manufactured lumber from its mill seventy miles north of Prince Albert. The work was done by means of a steam engine, operated over an ice road. The company will move its mill to a new limit near Candle lake.

Lumbermen's Interest in Game.

Prof. Fernow, of the University of Toronto, lectured before the Ontario Fish and Game Protective Association recently on the importance of preserving the forests, as far as the protection of fish and game was concerned.

The economic aspect of the forests, as well as both game and fisheries, and their maintenance as continuous resources of a country, he said, engaged the foremost interests of the forester. Just as the forest in Germany was managed for a sustained yield, with a view to furnishing continuous crops, so in the Government forests and waters, game and fish were managed for a sustained yield for continuity. In Germany the Government forests were divided into districts; each containing from 5 to 2,500 acres, with a chief forester as resident manager, who each year submitted a plan of specific operations. In this report was contained a statement of the game on hand, and a budget of the number of pieces of given description that it would be possible to shoot without diminishing the supply. This shooting plan, though, only referred to big game.

In making up the budget, the principle was to keep up a moderate supply of game without too much damage to forest and field; for it must be understood that game was liable to damage young plantations and neighboring field crops, and hence the forest interests and the game interests must be carefully balanced.

The obvious practical steps to be taken were: (1) The organization of a competent Government agency to inaugurate a forest management which involved more than a few half-hearted regulations in restricting the lumbermen; (2) increased vigilance in suppressing the forest fires, which would be easier and cheaper if carried on by permanent foresters instead of temporary rangers; (3) Withdrawal from the operations of existing timber license laws and reservation of all lands that were only fit for timber growing segregating the lands fit for settlement, and strictly preventing all unfit lands from being settled.

An Edmonton despatch reports that eight million feet of timber was cut in Poplar Creek camp. This is a record for Alberta.

The driving prospects on the Restigouche river and branches are good, and from present indications there ought to be good water. The recent snow storms have added much to the reserve stock, and the cold weather has not wasted the snow. With warm weather there will be abundance of water.

CAMP SUPPLIES

New York**THE NEWS**

Mr. E. A. O'Connor has purchased and is operating the new shingle mill, recently built by Chas. Warwick in South Vancouver, B.C.

The import of Nova Scotia and New Brunswick spruce and pine deals to the Mersey during the month of March exceeded that of March, 1907.

William Holden and L. M. Proctor, of Vancouver, have bought the plant, limits and interests of the Lillooet Lumber Company, at Port Haney, B. C.

The Lillooet Lumber Company, who have a mill at Port Haney, B.C., on the Fraser river, have sold out to Wm. Holden and L. M. Proctor, of Vancouver.

Improvements are being made to the Patrick mill, near Nelson, B.C., on the Kootenay river, which will considerably increase the capacity of the plant.

James B. Beveridge, who last fall was refused a bonus at Newcastle, is building a pulp mill at Lower Derby, about six miles from Newcastle. A rapid brook supplies water.

Mr. John R. Booth will bring down the Ottawa this year a raft of square timber, which may possibly be the last one of these striking features of the lumber industry of this section.

It is stated that the Quatsino Power & Pulp Company, Quatsino, B. C. have just completed plans for the construction of a large pulp mill and that work will start immediately.

The North American Land & Lumber Company, of Dubuque, Iowa, who have been operating the Cedar Valley mill at Fernie, B.C., will greatly enlarge their plant. Work will be commenced at once.

The Winnipeg Board of Control have instructed the city engineer to furnish estimates of the amount of lumber required in civic works this summer with a view to calling for tenders immediately.

Tenders will be received by J. Moore, reeve, Lakeside, Ont., up to May 15th, for 16,000 feet of cedar, 12 feet by 4 inches; 3,000 feet of cedar, 14 feet by 2 inches, and centre piece, 208 feet by 6 x 8 inches.

The condition of Mr. John Charlton, for so many years member in the House of Commons for North Norfolk, and a member of the lumber firm of J. & W. A. Charlton, has become so serious that his recovery is hardly expected.

The Canadian Manufacturers' Association has received an enquiry for collapsible furniture and canoes from Henry G. Halin, 19 Pelzerstrasse, Hamburg, Germany. They are required for the export trade on the West African coast.

Mr. Robert Watt, 201 Campbell avenue, has applied for permission to erect a brick building to be used as a planing mill and factory, at the corner of Campbell avenue and Tennyson avenue, Toronto, and to establish a general lumber business.

Vancouver timbermen met together recently and passed resolutions asking the federal government to cancel the clause in leases enforcing the cutting of timber and building sawmills on railway belt lands until the timber industry is in better shape.

British Columbia mills have their yards full, and there are logs on hand sufficient to last for six months. Coast mills have started again. Shingle mills have also resumed cutting, and by another month about all of the Kootenay mills will be going again.

Mr. J. D. Sinclair has disposed of his saw mill plant and timber limits, including water rights, etc., at Roy, B.C., to a firm known as Davidson, Ward & Company. The senior member of the new concern is Mr. J. M. Davidson, of the Alaska Building, Seattle.

The Sunset Lumber Company, Nelson, B. C., which has acquired timber limits on Vancouver Island, has been floated on a capitalization of \$200,000. The major portion of the stock has been subscribed locally, but there is also Winnipeg and Ontario capital invested.

With the development of the fruit-growing industry in British Columbia there is a demand for boxes, and different mills are putting in plants to supply these. The latest are the Loftus Bros., near Boundary Falls, and the Kettle River Lumber Company at Grand Forks.

The Hastings Sawmill, of Vancouver, claim to have the record cargo, being that shipped on the J. D. Everett to the United Kingdom in 1902. This information has come out because of the publication that the ships Sussex and Hillston took what was claimed to be the record cargoes from Puget Sound recently.

Inspection is being made by agents of the British Columbia Provincial Timber Department to see that hand loggers are complying with the regulations. A number of licenses are expiring, and as they are not renewable, the officers will make sure that operations are not continued beyond the time limit of the licenses.

On June 24th, at Ottawa, there will be offered for sale by public auction timber berths numbered 1 to 8, inclusive, covering the pine timber of nine inches in diameter and over at the Dokis Indian Reserve, situate on the French river. Particulars may be obtained of J. D. McLean, Secretary, Department of Indian Affairs, Ottawa.

Following are the officers of the Hastings Shingle Manufacturing Company, elected at the annual meeting recently held: President, A. C. Flumerfelt; vice-president, J. A. McNair; manager and treasurer, H. Davidson; secretary, C. H. Farrow; other directors, R. McNair, Jas. Ramsay, A. B. Erskine, R. J. Ker and D. M. Rogers.

By a large timber transaction recently closed at Vancouver by D. Van Wagener and J. G. Fitch, 250,000,000 feet of lumber within twenty-four miles of the city have changed hands. It is stated that \$400,000 will be expended in June upon the erection of a new mill. Mr. D. Van Wagener, mining engineer, of New York, represents the purchasers.

The appeal of the Independent Lumber Company of Vancouver vs. the Canadian Pacific Timber Company, in which \$30,000 was involved, has been dismissed. The Independent Company was suing for \$30,000 damages for breach of agreement to supply them with from eight to fourteen million feet of timber, and the defence set up was that there was not a completed contract.

Charles F. Lindmark, managing director of the Revelstoke Sawmills Company and mayor of Revelstoke, B. C., was on the coast recently and advocated the establishment of a college of forestry in British Columbia. He suggested that reciprocal arrangements be made between the provincial and dominion governments, with the end in view of training the most competent young men from the lumbering camps of the province.

American lumbermen have not all been so well able to weather the financial storm of the past season as their Canadian confreres. A report from Portland, Me., tells of the failure of S. A. Nye, of Fairfield. As an individual, and as a member

of three partnerships, he has filed a voluntary petition in bankruptcy. His liabilities are given at nearly \$1,000,000, which are mostly in the partnership business.

J. W. Stewart, of the railway contracting firm of Foley, Welch & Stewart, Winnipeg, was the successful tenderer for dominion timber lands between the Pease river and Lesser Slave lake. He secured 330 square miles for \$7,000, being the only bidder in each case. J. D. McArthur, another railway contractor, also of Winnipeg, has bonded fifty-one limits in the Kitimaat valley, owned by J. McKercher, Vancouver.

Mr. S. Baxter of Toronto, who recently made a departmental trip around Salt Spring Island brought back with him a set of photographs of a splendid stick of timber which was recently cut down on W. E. Scott's land near Ganges Harbor by axemen in the employ of Messrs. Marrett & Company, loggers. This tree furnished a log of clear timber 200 feet in length and 10 feet in diameter at some 8 or 10 feet from the ground.

Lumbermen working on the Northern British Columbia coast have formed an association which will work in harmony with the other associations of the province. The officers of the new organization, known as the Northern British Columbia Manufacturers' Association, are: J. M. MacKinnon, honorary president; W. B. Stephenson, president; R. G. Cunningham, Capt. McCroskie and G. S. McTavish, vice-presidents; C. A. Dunlap, secretary-treasurer.

Among recent concerns to secure incorporation are the Pennsylvania Lumber & Mineral Company, Limited, Toronto, Ont., capitalized at \$100,000; incorporators, J. F. Ancona, T. C. Ancona and C. J. Peters, all of Reading, Penn., and others. Also the Burchard Lumber Company, Saskatoon, Sask., capitalized at \$100,000, the incorporators of which are C. J. Burchard, of Saskatoon, Sask., E. E. Heiner, H. Pierce, G. H. Poirier and H. Stoltze, all of St. Paul, Minn.

In the British Columbia interior, the cutting of ties has created an activity among lumbermen. Three-quarters of a million ties will be taken out this year, some of the large contractors being D. B. Dulmage, of Cranbrook, who will get out 150,000, and more when those are ready. C. R. Riel, of Creston, has cut 100,000. On the coast, G. T. P. orders for ties and timbers have brought business to the mills at Tynehead, Haney, Hammond, and the Brunette Sawmill Company.

In Amherst, N.S., a new company is being formed, to be known as the Amherst Woodworking Company, with \$100,000 capital, which will take over the interests of the Sillicker Company, Limited. The Sillicker Company, of Halifax, will take a large share of the stock. D. G. McDonald, lumberman, of Truro, N.S., will also be heavily concerned in this new enterprise. The company will carry on a business similar to that carried on for years in Amherst by the Sillicker Company, but on a larger scale. Stock is being subscribed in Amherst.

Efforts are being made to secure at least a portion of H. A. Jones' boom, which was lost outside the Narrows at Vancouver recently, when being towed round to False Creek by the "Clara Young." The logs were scattered along the beach from Gower Point to Mission Point, and the tug Le Roi was sent up to see what she could do in the way of salvage. A number of logs have been washed ashore at Roberts Creek, and six teams were busy dragging them beyond high water mark, and piling. It is hoped that the bulk of the logs will be recovered.

Edward Henderson, of Crescent City, Cal.; J. N. Brittain, of Ballard, Wash., and the Chippewa Lumber & Land Company, of Wisconsin, are the defendants in a suit brought by Canadian claimants of limits near Alberni, on the west coast of Vancouver. Seventy-nine claims were staked last summer by the Americans, but it is stated that forty-two of these interfere with the thirty-seven staked by the Canadians. By the new law, the dispute is settled in the court, instead of by the Chief Commissioner. The court is asked to set these forty-two aside and to give damages if fraud is proven.

A large and representative gathering of lumbermen, mill and business men, affected by the order of the Dominion Government respecting the operation of timber licenses within the railway belt, was recently convened in Vancouver. The meeting passed a resolution which fully stated the conditions existing, and the hardship that would be worked upon the business interests of British Columbia should the order be enforced. A petition, the terms of which were similar to those of the resolution, was prepared and circulated among those present, and will be more extensively circulated before being forwarded to Ottawa.

A painful accident, that nearly proved fatal, occurred a short time ago in Pellissier's sawmill, at St. Peters, in the district of Wakefield, Que. An employe, named Prevost, was attending a circular saw when in some way a piece of wood stuck to the machine saw. Prevost jumped on to the saw table and tried to kick the piece of wood off. In doing so his foot caught in the saw and he was being drawn in to certain death when a fellow workman with remarkable presence of mind jumped to the brake and applied it just as the saw cut through one of Prevost's arms. As it was his leg was broken and his arm hanging. He was immediately bound up as well as his companions could manage and hurried to the railway station. Arrived at Ottawa he was taken to the Water street hospital, where both the leg and arm were amputated.

Recent British Columbia incorporations include the following: Terminal Lumber & Shingle Company, Limited, capitalized at \$100,000; president, T. F. Paterson; manager, W. Cooke. Victoria Tie & Timber Company, Limited, capitalized at \$10,000. Vancouver Island Logging & Mill Company, Limited, capitalized at \$10,000. Valley Timber Company, Limited, capitalized at \$25,000; head office, 1605 Georgia street Vancouver; G. F. Gibson, director. Westholme Lumber Company, Limited, capitalized at \$25,000, succeeding the lumber manufacturing business of Frank Lloyd, Westholme, Vancouver; among those interested is Chas. D. McNab, of Cranbrook and Island. Wilson Logging & Timber Company, Limited, capitalized at \$50,000; head office, 45 Davis Chambers, Vancouver; P. A. Wilson, manager. Watkins Logging & General Contract Company, Limited, capitalized at \$100,000. Western Lumber Company, Limited, capitalized at \$50,000; head office, Fernie; R. W. Wood, manager.

The annual general meeting of the E. B. Eddy Company, Limited, was held recently at their head office, Hull, when the president and treasurer, Mr. W. H. Howley, presented the statement of last year's operations before the shareholders, and reported that the company had a fairly profitable year in 1907, notwithstanding the increased cost of materials used and in spite of the serious competition and cutting of prices in some of the important lines they manufacture. The heaviest cuts were in woodenware and in paper bags, of which they have a large enough capacity to supply the bulk of the trade in Canada. Mr. Rowley reported that there had been no "let up" in the volume of the company's business throughout Canada, where they have nearly a score of branches and agencies and depots established, all the way from Halifax to Victoria. While sales in some lines had fallen off owing to competition, sales in other lines had increased more than enough to counterbalance this. Directors were re-elected as follows: S. S. Cushman, vice-president, J.P.; (Mrs.) J. G. H. Eddy, J. J. Gormully, K.C., G. H. Millen, joint manager, W. H. Rowley, J.P., president and treasurer.

"QUALITY IS THE BEST POLICY"

"Goods Well Bought are Half Sold"

WE do not know the origin of this quotation, the truth of it, however, is thoroughly realized and universally accepted by retailers of all lines of goods.

"WELL BOUGHT" can be given a variety of meanings but the only true definition is—the best value for the least money. Some people believe "well bought" synonymous with "cheapest price" without regard to the value received. This is poor judgment and a disastrous business policy to pursue. The success of our "Quality" policy has proved to our entire satisfaction that the lumber trade of today are fully alive to the benefits derived from handling the very best.

We have by far the best facilities for manufacturing, drying and dressing Spruce, found in Canada. It takes time, money and infinite care to keep our standards at all times up to the required mark, but it pays in the satisfaction of our customers and ourselves.

Our Springfield, Mass., sales office will take pleasure in quoting on your requirements for Flooring, Ceiling, Partition, Novelty Siding, New Brunswick Cedar Shingles, Lath, etc.

INSERTED TOOTH **SAWS**
and all Solid Tooth Circular

There are more DISSTON BRAND Band and Circular Saws used than any other make, and by a large majority.

WHY?

Because millmen and sawyers recognize by the use of the DISSTON SAWS they obtain the greatest results for the least cost.

WE MAKE THIS STATEMENT WITHOUT FEAR OF SUCCESSFUL CONTRADICTION.

POINTS OF MERIT

MATERIAL

FINEST
CRUCIBLE STEEL

UNIFORMITY.
TOUGHNESS.
GREATEST TENSILE STRENGTH AND ELASTICITY.

**HARDENING
AND
TEMPERING**

DISSTON
METHOD

Being Manufacturers of our own steel, and thoroughly familiar with its makeup, we are able to absolutely adjust the hardening and tempering processes to the degree giving that perfect combination of hardness and toughness that produces the "edge, tension-holding and standing up qualities" for which the DISSTON SAWS are renowned.

GRINDING

DISSTON
METHOD

By the DISSTON METHOD all Band Saws are ground perfectly flat and uniform in thickness, thus making possible a very close adjustment of the guides without creating any friction or heat when in operation at the highest rate of feed; and all Circular Saws, whether tapered or of even thickness, are perfectly flat ground on the surface, thus insuring in all saws perfect clearance and true balance.

TENSIONING

DISSTON
METHOD

The uniformity of the material, temper and grinding is a large factor in the proper adjustment of tension; and this, together with the Disston process of tensioning, is the reason why the DISSTON SAWS will manufacture more lumber, under the same conditions, than any other brand of saw.

In the DISSTON BRAND of SAWS you have the advantages of the product of a progressive, up-to-date saw factory, the LARGEST IN THE WORLD, and where saws are made throughout, from the making of the steel itself—the superiority of which has been demonstrated for the past fifty-three years—to the finishing operation, and each process is performed by mechanics of long experience and highest order of skill.

WE HAVE BEEN MAKING SAWS FOR OVER 68 YEARS

TO MILL MEN SOMETHING NEW

You will find that by using

FREEZE'S PATENT BELT LACING TOOLS

you will save more than half the time usually lost in lacing belts. Consider—

How much do you lose every year by reason of machinery standing idle while belts are being laced.

You can stop over half of that leak by using the above named tools for running leather laces into belts. They will be sent to any address in Canada by mail on receipt of price with order, and with ordinary care they will last a life-time. Price 50 Cents Each.

Edward Clark & Son
123 Bay Street, TORONTO**Reliable
Veterinary
Remedies**

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are

Johnson's Horse Liniment No. 1.

A penetrating Alcoholic Liniment.

Put up in one gallon jugs, with full directions, per imperial gal. \$4.50

Johnson's Horse Liniment No. 2.

A combination of the best oils used as liniments, imp. gallon . \$3.00

Johnson's Horse Colic Remedy.

A sure and speedy cure for colic. Imperial gallon \$5.00

Johnson's Veterinary Healing Ointment.

Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada.

Put up in 2 lb tins, each . . \$2.25

or in 1/4 lb tins, per dozen . . \$3.50

Johnson's Condition Powders. (Concentrated).

Put up in bulk, per lb 30c.

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating liniment, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to \$100.

Send postal for printed matter.

Saw Mills and Planing Mills located on C. P. R. and Ottawa River 70 miles west of Montreal

WANTED!

LUMBER OF ALL KINDS, BOTH HARD AND SOFT.

We do not really mean that we are in the market for lumber. We simply wish to attract your attention, so as to get an opportunity to observe that when the market is off THE LUMBER THAT IS MANUFACTURED THE BEST IS THE MOST READILY SOLD.

It is impossible to make perfect lumber without a first class edger and trimmer, the edger giving the boards STRAIGHT AND PARELLEL EDGES and the trimmer reducing them to STANDARD LENGTHS AND SQUARING THE ENDS.

We make a specialty of edgers and trimmers, manufacturing the well-known "TOWER" line, which consists of

THIRTY DIFFERENT SIZES AND STYLES OF EDGERS

and

TEN DIFFERENT SIZES AND STYLES OF TRIMMERS—

All with every modern improvement

Our trimmers do MORE work in a given length of time than any other 2-saw trimmer on the market, and that with LESS fatigue to the operator. They also waste the LEAST lumber.

Front View of "TOWER" One-man 2-saw Trimmer, Small Size.

This Saw Stands Without a Rival
AND IS THE
FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

MANUFACTURED BY

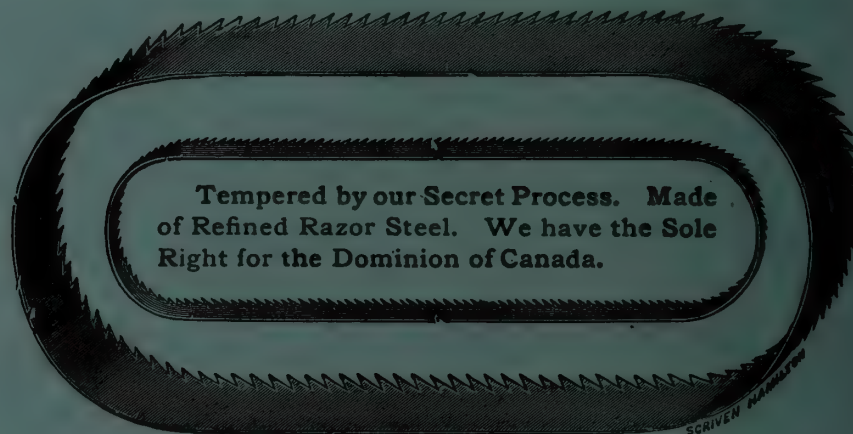

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. On receipt of 40 cents we will send one by mail.

We are the only manufacturers in the world who export Saws in large quantities to the United States.

We Manufacture
HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Razor Steel, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

"The Canadian Lumberman and Woodworker" is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canadian Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

TORONTO — MAY 15, 1908 — MONTREAL

Two Pressing Grievances.

At the recent meeting of Ontario lumbermen, to discuss the matter of freight rates and also that of the competition of the United States yellow and Georgia pine, with Ontario woods, which was held in Toronto, there was a most unanimous agreement upon these two subjects. It is a great pity at this time, when the consumption of lumber products has fallen almost lower than it has ever been before, that the little amount of business still available for Ontario producers in supplying the ordinary building demand should be suffering from competition from a foreign country. When this competition is assisted by the Ontario Government who are ordering the foreign woods for use in public buildings, the lumbermen certainly have a right to complain. If the question were only one of cost and there were a decided margin in favor of the foreign woods, it would be up to the lumbermen of Ontario either to reduce their prices or say nothing. This, however, is not the case, for although there is a slight advantage in favor of the southern lumber it is not sufficient to warrant the Government in adding to the depression which has already effected the trade in Ontario. The state of affairs from the lumberman's point of view comes down to this; either he must be content to do nothing, and possibly allow his business to go into the hands of receivers, or he must slaughter his prices to an extent that will be equally ruinous. The producers of the United States yellow pine and Georgia pine are confronted with a somewhat similar situation to-day. Their business has been destroyed by the general trade depression and they must either go out of business or sell their stocks at a loss, in order to provide themselves with ready money and if possible tide over the depression. For this reason they are getting rid of what lumber they can in Ontario, at prices much below the cost of production. The policy of the Government in connection with the matter is tending rapidly to reduce Ontario lumbermen to the same unfortunate situation. The Government certainly cannot attend to the matter too soon. Every assistance will be useful in helping the trade to get through the dull times.

When the lumbermen discussed the matter of freight rates they found themselves handling a simple matter of trade relations with a large corporation. Their task was to persuade the railway companies that it would be to their mutual interest to restore the rates to their old basis. Of course there is the other way out of the difficulty, that is, a reference to the Board of Railway Commissioners, but it would certainly be to the advantage of both parties, if possible, to settle the matter amicably between themselves. Increased freight rates, it is believed by the lumbermen would be an intolerable burden at the present time. At this time last year they could have been borne with ease. To-day the trade is almost dead from other causes and additional

freight rates may serve to give a finishing blow. With judicious nursing it is felt by most lumbermen that the trade could worry through the coming season and be in a position next year to expand. But it will need all the assistance that the railway companies and the Government, and all other outside agencies can afford, to bring about this condition.

Indications of Improvement.

The C. P. R.'s latest crop report shows that in some sections, as much as 95 per cent. of the seeding has been completed. In other parts of the West cold, rainy weather has retarded operations. Without exception, however, seeding is much in advance of other years. It is a matter for everyone to be thankful for, lumbermen among them, that crop conditions should be opening so promisingly during this year, when financial conditions are so disturbed, largely by the bad crop of last year. Already reports show that the lumber business in the West has felt a slight stimulus on account of the probability that there will be a good crop. It takes most businesses a long time to recover from a financial scare, and it is not to be expected that there will be anything more than an average year's business for the lumber trade this year. But there are outside influences at work which may conceivably have more than a passing effect. The fact that there are many lumber manufacturers from the United States investing in British Columbia properties is certain to have a beneficial effect. One cannot witness the evidence in others, of faith in a country without having his own faith stimulated. This is going on in British Columbia to-day and is a certain sign that if recovery can be effected in business anywhere it can be expected there sooner almost than anywhere else. In older Canada, conditions are not so promising, and there are reports from many parts that manufacturers are afraid their next season's operations may have to be curtailed, unless the present season improves more than it promises to. But even this fear is as yet only a visionary one and manufacturers are still prone to believe that a rift will soon appear in the clouds and enable them to see further into the future than they can today. A favorable indication is the reported improvement in the English demand. Although this is by no means extensive, it has attracted attention from many quarters, and promises to increase. In Ontario also there are indications of a stronger feeling among the manufacturers, and it begins to look as though they will be justified in having sat tight so long, on the question of prices. There is not much time left now for deciding upon the season's manufacturing programme. The drives in most sections are well under way and mills will soon have to commence cutting. Many of them have already done so, but others are still holding back. Taking everything into consideration, conditions are more favorable than they were a fortnight ago, and the indications are that with judicious nursing the lumber business may be able to recover slowly and be on a fairly healthy footing before the end of the season.

Our Pulp Wood Supply.

Mr. E. N. Lewis, M.P. (West Huron) is to be commended for the activity he has displayed in the cause of protecting Canada's pulpwood supply from being exhausted. He has brought the matter to the attention of the House of Commons, and to a certain extent has succeeded in obtaining definite results. Sir Wilfrid Laurier, replying to him in the House, stated that the Government would be glad to appoint a committee to examine into the whole question of timber exhaustion in Canada. The necessity for such an examination is urgent, and the question itself is attracting, to-day, the attention of all countries with timber resources. It will be greatly to the advantage of Canada's lumbering industry if an accurate Government report upon the whole matter is compiled.

Black Paper and White Ink.

The latest method for saving the forests from the ravages of the paper mills is a most ingenious one. Wisconsin manufacturers of print paper have put forth a proposition which, if adopted, might revolutionize the print paper industry and the newspaper industry as well. They propose that newspapers in the future be printed in white on black paper instead of black on white paper, thus bringing about a saving of millions of dollars annually in pulpwood, assisting in the preservation of forests and reducing the price of news paper to about one-half the present price. Black paper can be made of old newspapers and almost any fibrous stock, while white paper requires spruce and hemlock wood. Wisconsin paper manufacturers will try to interest eastern manufacturers, and, if possible, bring about concerted action with the publishers of the country.

Canada has the largest pulpwood areas in the world. The first paper mill in Canada was started at Jacques Cartier, Que., by a Mr. Jackson in August, 1800.

Freight Rates and Southern Competition.

A meeting of Ontario lumbermen, called by the Ontario Lumbermen's Association, was held in the Queen's Hotel last week for the purpose of discussing a number of matters of interest to the trade. Mr. W. A. Charlton occupied the chair and the following lumbermen were present: W. A. Charlton, J. & W. A. Charlton, Toronto; W. C. Laidlaw, R. Laidlaw Lumber Company, Toronto; F. N. Waldie, Victoria Harbor Lumber Company, Toronto; W. B. Maclean, Conger Lumber Company, Toronto; W. J. Smith, John B. Smith Sons, Limited, Toronto; H. J. Bartlett, Temagami Lumber Company; Geo. Gordon, Sudbury; W. A. Firstbrook, Northern Lumber Company, Limited, Toronto; W. W. Carter, Fesserton; H. E. Craig, Firstbrook Box Company, Toronto; Clarence Conely, Loveland & Stone, Cutler, Ont.; E. B. Foss, E. B. Foss & Company, Bay City, Michigan; J. B. Miller, Parry Sound Lumber Company; D. L. White, Jr., Playfair & White, Midland; A. McColl, Simcoe; Geo. Thomson, Goderich Lumber Company; E. C. Barre, Cleveland-Sarnia Saw Mill Company; W. J. Sheppard, Georgian Bay Lumber Company; W. E. Bigwood, Graves Bigwood & Company; R. S. Waldie, Victoria Harbor Lumber Company; John Walsh, Transportation Manager, Canadian Manufacturers' Association; John Donogh, Imperial Lumber Company, Bracebridge; C. Beck, Penetanguishene; Geo. M. Warren, Imperial Lumber Company. Letters of regret at their inability to be present were read from Messrs. Loveland & Stone, Cutler; Knight Brothers, Burke's Falls and the White Pine Lumber Company, Detroit.

Among the questions discussed, one of the most important was the fact that a large amount of United States yellow and Georgia pine is coming into Ontario to-day in competition with native woods. This competition is looked upon as being unfair, inasmuch as the lumber is dumped upon this market at prices which must be absolutely ruinous to the seller. In the discussion that took place upon this subject it was pointed out that in a great many of the public works of the province, the specifications for such buildings as collegiate institutes and stations on the T. & N. O. railway called for finishing in southern pine, and in the case of cars, that southern pine should be used for decking and sheeting. The outcome of the discussion was the adoption of a resolution which was forwarded to the Ontario Government. The resolution cited the action of the Government in the matter and said that the association desired to call attention to the fact that southern pine is inferior in quality to Canadian timbers in strength and durability, as has been demonstrated by conclusive tests; that southern pine is largely manufactured by convict and negro labor, and it is only by reason of the employment of such labor and alliances with railroad interests that it can be delivered in this province in competition with native timber; that such a course is contrary to the policy of the Government, as expressed in the legislation prohibiting the export of saw logs, and the manufacturing condition inserted in the timber licenses of the province of Ontario, which is expressed, to be for the purpose of encouraging manufacturing within the province. Such a course on the part of the Ontario Government is unfair to the lumbermen of the province of Ontario who contribute the greater part of the revenue of the province in the high prices paid for stumpage and crown dues, and who are the chief source of employment in Northern Ontario, and has the effect of putting the workmen of Northern Ontario who have to make their living in lumber camps and saw mills, under the rigorous conditions of our northern climate, in competition with convict and negro labor operating under the cheaper conditions of southern climates; further, that such course is calculated to have an injurious effect upon the marketing of Ontario timbers in foreign markets. The fact of southern pine being specified by the Ontario Government will be pointed to as a demonstration of its superiority over Canadian timbers, contrary to the fact. Therefore, this meeting urges in the strongest possible manner that the Ontario Government in all its departments and the Temiskaming and Northern Ontario Railway Commission cease to specify the use of southern pine for any purpose, and in all its specifications and requisitions for lumber or timber, require the use of lumber and timber grown and manufactured in Canada.

The next important discussion was introduced by Mr. W. C. Laidlaw who called attention to the fact that very important changes had been made in railroad freight rates for Ontario, and had become effective on May 1st. After a lengthy discussion upon the subject the following resolution was passed: "whereas the C. P. R. and G. T. R. have issued a new tariff on forest products in Ontario becoming effective on May 1st, 1908, and whereas the rates have been advanced from all large lumber producing points in northern Ontario to the large consuming centres such as Hamilton and Toronto, and have been reduced from points in many cases where there have been no sawmills for years; or to points where the consumption of lumber is small; be it resolved that the Board of Railway Commissioners be respectfully urged to order the railway companies to restore the freight rates in force prior to May 1st, on forest products, in all cases where the rate has been advanced; on the following grounds:

1st; the lumber trade is suffering from business depression, fall-

ing off in consumption of over 50 per cent.; half a million of unsold stock, and depression in values, so that the traffic will not bear the increased rates.

2nd; the advances made are unfair and unreasonable and deserve unqualified disapproval in themselves.

3rd; no due notice was given to the trade, but the advances were made effective at once on May 1st.

4th; during the past, lumber shippers have had very scant consideration from the railways in the matter of car supply, switching service or the movement of traffic and have suffered direct loss amounting to thousands of dollars from the failure of the railways to give proper service.

5th; lumber and forest products furnish the railways of Canada, the largest tonnage of any class of goods except coal. The railway statistics blue book for June 30th, 1907, shows the year's lumber tonnage in Canada to be over 10,000,000 tons.

6th; lumber is the only class of goods that is required to furnish its own loading equipment of car stacks and crossers for loading on freight cars.

7th; that the railways of Canada have been steadily improving their net earnings, is a statement made and illustrated by the Department of Railways and Canals in the railway statistics blue book of June 30th, 1906 and 1907. This should demand a reduction in rates, but not an advance.

8th; the minimum weight of car lots of lumber has been increased without any corresponding reduction in freight rates.

A lengthy discussion took place upon these matters and a number of other matters of internal interest to the trade. Finally an arrangement was made for the lumbermen to meet the representatives of the railways on May 28th and discuss the matter of freight rates. The meeting will be held in Toronto, probably at one of the railway offices. It is thought that the difficulties can be overcome more readily by a mutual discussion than by taking the question before the Board of Railway Commissioners.

The Bargain Selling Evil.

When lumber dealers are sitting tight and manufacturers tighter still, as they are to-day, there is not much sympathy to be found for the bargain-hunting lumber buyer who seeks with much industry to find low prices, and sometimes gets poor stock. In the best of times he is not popular, but to-day he is more apt to be greeted with the word "stung" than with sympathetic consolation. The American Lumberman, speaking of this point, says on the other hand that it is hardly fair to blame the buyer for this disturbing effect of the bargain selling habit. The sellers of lumber are at fault and, while they would probably admit individually that this is true, they go on making bargain offers on stock that they are anxious to move.

This statement applies to yellow pine, cypress, hardwoods and everything in the lumber line. One mill, while it holds to its prices on what are termed regular lines of stock, will possibly have a block of something it wants to move and on this will make a special concession of \$2, \$3 or \$4 below regular price. Inasmuch as it maintains prices on its other stuff it does not consider that it is cutting prices or reducing market values; yet one man offers a bargain in one thing, another a bargain in something else, and so on until, between the different mills, the shrewd buyer can find nearly everything he wants on somebody's bargain list. The result is that these bargain lists really set the prices for lumber. Each man may delude himself with the idea that it is all right since he has to move certain stock, and will hold to his original prices on everything else. Numbers of dealers are doing the same thing, however, and because of the wide variety of bargains they offer the natural effect is to turn the lumber market into a bargain counter. This method of selling also has the effect of concentrating people's minds on the bargains so much that they do not look for anything else and when a mill is rid of its bargain offerings it finds itself out of the market in the matter of getting orders; then it drags along until it is anxious to move another accumulation of stock and offers another bargain price. Some of the mills urge their salesmen to put these bargain prices forward and sometimes offer extra inducements for the sale of bargain list stock when it would be better for the market if the bargain list were abolished entirely.

An English report says that a new form of contract suggested by the Importers' Section of the Timber Trade Federation of the United Kingdom has been submitted to various shippers or their agents. From a cursory inspection of the document in question it appears as though the new conditions proposed will lead to much discussion, and will probably be objected to somewhat strenuously by the various associations of foreign shippers. It is to be presumed that the matter will be thoroughly discussed by a joint committee of importers and the representatives of the shippers.

Market Correspondence

Prices Stiffening at Ottawa.

Ottawa, May 11.—Mr. J. R. Booth has just declared his prices for the present season, and the result has been a steadying effect on the lumber market. His prices vary so little from last year as not to affect middlemen who had purchased from manufacturers last fall, figuring on continued firm prices. Manufacturers at Buckingham and other small towns reported a slight decline in last year's rates at the beginning of the month, but since Mr. Booth's quotations have been given the market is quite strong. This means a great deal to dealers, for a large quantity of stock had remained over from last season. The present outlook for the trade is brighter than at any time since the depression caused by the money stringency near the close of last season. Cox and Burstall are shipping heavily from Booth's yards since the opening of navigation. While they do not contemplate as large a movement as they did at this time last year, the fact that many English firms have not yet purchased, tends to make local lumbermen optimistic. Reports from the United States indicate that there will be a good deal of buying for building. The outlook is promising for much activity also in local building operations, following the real estate boom. There is a dearth of houses in Ottawa and vicinity, and the high rents, 20 or 25 per cent. above last year, are attracting considerable capital into building. There is no prospect of serious trouble with the building trades, as a two-year agreement with some of the most important unions last year excludes any possibility of a wage dispute.

The demand for hemlock and spruce is very brisk. Sound lumber in these varieties is much cheaper than in pine, and builders purchase it for the sake of economy.

The exceptionally high water in the Ottawa river and its tributaries is a source of danger to lumbermen. The rain and snowfall, amounting to 17 inches of water since last December, swelled the Ottawa to its greatest depth since 1876, when a large quantity of lumber was swept away in the vicinity of Chaudiere Falls. The abnormal expansion of the Lievre river proved such a strain on the boom of the James MacLaren Company at Buckingham, Que., that on May 2 it broke and allowed about 30,000 logs to escape. On May 4 another 12,000 broke away from the same place. It is expected the company will find it more convenient to dispose of these logs to some other manufacturer than go to the expense of bringing them back. The timber carried over from year to year is more than enough to insure a supply of logs to keep the mill running during the season, so that sawing operations will not be interfered with.

The floods came up over the W. C. Edwards Company lumber yards at Rockland and the docks had to be loaded to keep them from floating away. The water prevented shipping by cars, which was a serious drawback, as all the lines of lumber could not be reached by boat. Some small lumber mills on the Gatineau are threatened by the rampage of the waters of the Joseph river, 30 miles above Maniwaki. The dams are broken and the waters of the smaller stream sweeping down the Gatineau are dangerous. Fearing trouble at Fort Coulonge, James Davidson started operations earlier in his mill there and disposed of a large quantity of old logs to make room for the new timber.

The rise in the Ottawa both above and below the Chaudiere has been so marked as to endanger the value of the falls for power purposes, but the situation in this respect has improved in the last few days.

Driving operations are kept back by ice, which is still firm on Lake Temiskaming. The drive began on upper Ottawa tributaries in the last week of April, but is progressing slowly. There is no danger, however, of a shortage of water when the logs are released. The saw mills in the Ottawa valley are all in full swing, with every indication that the season will be as large as last year for output of sawn lumber, despite the falling off in the log cut. The lumbermen are paying the same wages as last year, and labor is so plentiful that night operations can be carried on whenever desired.

Activity on New Brunswick Drives.

St. John, N.B., May 6.—The present week has been on of great activity all along the St. John river and its tributaries. From the mouth to the smaller tributaries the logs are under way. The ice has run out in tremendous quantities during the last few days, and the freshet has risen about ten feet at Fredericton. The rise of water has been steady and gradual until to-day, when the freshet seems to be at a standstill.

A large crew of the employees of the St. John River Log Driving Company succeeded in swinging the booms at the rafting works at Fredericton on Sunday night last. Early the next morning, a mass of ice, many miles in length and filling the river from bank to bank, came down with the current and broke the booms. Among the ice were great numbers of logs which had been lying in the stream at Grand Falls. The number which ran past Fredericton is estimated at from two and one-half to three millions of feet. They are mostly spruce and the much greater part are "new" logs, having been cut during the past winter. They are owned principally by Stetson, Cutler & Company, and A. Cushing & Company, of this city, and the Ashland Lumber Company, of Ashland, Me. While there is little doubt that a number of the logs will go out to sea, the great majority of them will be picked up between Fredericton and St. John and brought to the latter place to be sorted and rafted. The extra expense under such conditions is about \$3.50 per thousand feet. Twenty-four hours after the booms had been broken they had been again placed in position and have since been intact.

Stream-driving has become general on the St. John and its tributaries during the past week. Conditions so far have been unusually favorable, and the prospects for a clean drive are strong. The snow, owing to continued cold weather, melted very little until the warm weather set in about a week ago. Since then the snow has been melting rapidly, and a good head of water is the result. From two to three feet of snow remains in the woods in the more northerly sections.

Good driving prospects are reported from the Miramichi and the freshet on the Restigouche and its tributaries promises to establish a record. The favorable conditions are being taken advantage of by the log-owners, and the work is being pushed with all possible expedition.

The conditions in local lumber manufacturing circles continue. Many mills which have usually, by this date, turned out several millions of feet, have as yet shown no signs of life whatever. Only four of the larger mills are running and at none of these is there anything doing in the way of manufacturing cedar shingles. No satisfactory arrangement has yet been made with the shingle sawyers in regard to wages. The consequence is that the export shingle trade is entirely dead. The provincial and local trade, which disposes of tremendous quantities of "second clears" and "Ex No. 1's," is fairly good this spring, and the result is that there are absolutely no "second clears" for sale in or about St. John, all that were wintered by local manufacturers having been disposed of. While there are considerable quantities of "Ex. No. 1's" still on hand, this line of goods is also growing steadily scarcer.

The present condition of trade in all kinds of long lumber, both for the English and American markets, shows little activity. Little buying is being done in advance and the shipments of the present month will be the lightest of any corresponding month for many years. The lightness of shipments, together with the lack of favorable prospects, has had a weakening effect on freight rates by water in both trans-Atlantic and western shipping circles. The most recent charters to the west coast of Great Britain are at figures ranging from 31s. to 32s. 6d. per standard on spruce deals. On such cargoes as have gone to the west the following rates have been named in the bills of lading: Long lumber, to Boston, \$2.50; lath, to Boston, 50 cents; long lumber, to the Sound, \$2.75; long lumber to New York, \$3.

Pigeon River Mills Re-opened.

The Pigeon River saw mills plants have been put in operation again, after a shut down of several months.

Between 250 and 300 men were put to work and the force will be increased slightly as the plant gets down to its bearings and the full capacity of the mill is made possible. The cut this year as compared with last will be increased by about 12½ per cent. To make this possible the winter months have been employed to remodel the saw mill. A large amount of new machinery has been installed and all of the machinery that was in use has been overhauled and made as efficient as new. The result has been to increase the capacity of the plant from 200,000 every 20 hours to 225,000.

A new engine of 800 horse-power has been installed, taking the place of the old 400 horse-power plant, which has served from the establishment of the mill six years ago. The Pigeon River mills are now the most modern in Canada. The planing, shingle and lath mills have also received an overhauling.

The Pigeon River Company have a large supply of logs in the rivers, which were cut during the past winter and will be more than their plant can manufacture. Last year some logs were hung up in the bush, but this year conditions were such as to enable the taking out not only of the immediate cut, but also of last season's cut. One drive has already come down the Whitefish and Kaministiquia rivers, while the Pigeon river drive is part way down to the lake now. Towing to the mill will be commenced as soon as the logs are in the lake, and will be continued all summer.

The British Columbia Trade

Mountain Men Oppose New Regulation.

A large representation of the Mountain Lumbermen's Association met in the parlors of the Hume Hotel, Nelson, recently, to discuss the general condition of the lumber industry. Incidentally there was also brought up for discussion the action of the Dominion Government in enforcing certain regulations as to license holders. The question of prices was also taken up thoroughly. Among those present was a delegation from the coast, consisting of Messrs. De Pencier, of the North Pacific Lumber Company, Vancouver; P. D. Roe, of the Roe-Cuddy Lumber Company, Port Moody; F. Beecher, of the British Columbia Mills Timber Company, Vancouver, and Mr. Small, of Messrs. Small and Bucklin, of New Westminster. Among the mountain lumbermen present were P. Lund, of the Crow's Nest Pass Lumber Company, Wardner; Otis Staples, of the Staples Lumber Company, Wycliffe; A. McDougall, of the Fernie Lumber Company; F. C. Dubois, of the Elko Lumber Company, also of Fernie; A. F. Krapfel and H. G. Hoppins, of the North Star Lumber Company, Elko; E. Home, of the East Kootenay Lumber Company, Cranbrook; A. F. Dudgeon and F. E. Sine, of the Bowman Lumber Company, Revelstoke; E. F. Sanders, of the Columbia River Lumber Company, Golden; S. R. Mundy, of the Mundy Lumber Company, Three Valley; F. L. Buckley, of the Rogers Lumber Company, Enderby; G. A. Summers and J. B. McGee, of the Adams River Lumber Company, Shuswap; Otto Lachmund and H. G. Hoppins, of the Lamb-Watson Lumber Company, Arrowhead; T. Ludgale, of the Big Bend Lumber Company, Arrowhead; C. D. MacNab, of the Baker Lumber Company, Waldo; H. H. Ross, of the Ross-Saskatoon Lumber Company, Baynes lake; A. E. Watts, of Wattsburg, and representatives of the mills having headquarters at Nelson and in the immediate vicinity.

The most important discussion was of the Government's announcement of its intention to enforce the clause in the timber regulations requiring license holders of Dominion lands to erect saw mills within six months, ensuring an annual cut of 100,000 feet for each square mile held under license. This was felt to be an injustice, as there was no market opening of any extent in the Northwest and in all probability there would not be until such time as the harvest in those provinces had been secured. Hence a strong resolution was passed against the proposed action and a petition to the Government is being drawn up praying that such action be deferred until the conditions of the market warrant its enforcement.

G. O. Buchanan, president of the Associated Boards of Trade, addressed the meeting upon the subject of forest preservation and kindred topics, his remarks being listened to with great interest.

A very full discussion of the general situation of the industry took place and the matter of supply and demand was fairly considered. It was asserted by a large percentage of the lumbermen that they did not intend to start up their mills before the end of May or until the crop conditions in the Northwest were further advanced and some idea could be had of the harvest.

In any event it was conceded that the output would be considerably under that of last year, both as to logging and as to manufacture. The stocks on hand were all produced under conditions of high priced labor, and it was generally stated by the lumbermen that there was no margin of profit in selling this lumber at present prices, especially when together with the cost of labor one considered the high rates of interest and the fixed charges accumulating on stocks carried over from last year. Hence there was no change made in the present price list. Prices are thought likely to be firm with a probable advance in the near future.

British Columbia Stocks Heavy and Prices Low.

Mr. Anstie, secretary of the Mountain Lumbermen's Association, in an interview at Nelson, regarding the announcement of the Dominion Government that it intends to require the cutting of 100,000 feet of lumber per square mile and the erection of a saw mill within six months, by license holders on Dominion lands, said that stocks of lumber on hand in British Columbia, as well as Prince Albert and at other spruce mills, are greatly in excess of the demand to be expected for many months to come. To-day 90 per cent. of the mountain mills were inactive and could see no warrant for the early resumption of operations.

"At the coast," continued Mr. Anstie, "at least 75 per cent. of the mills and 90 per cent. of the logging camps have been closed for the past five months; and the majority cannot yet resume operations, through want of a market. That the British Columbia Government realizes the serious position in which the lumbermen find themselves is well shown by the recent order-in-council suspending for a time the

export of logs from the province in order to assist the lumbermen financially and to save a large portion of timber in the water from destruction by the torredo worm.

"A short time ago a large mass meeting of lumbermen and representative business men met in Vancouver and passed a strong resolution setting forth the reasons why the Dominion Government's proposed action would work a great hardship upon the industry. The resolution protested in emphatic terms against the enforcement of the regulation as to the erection of saw mills. It is felt that the bringing in force of this regulation would mean confiscation by the Government of large vested interests, as the general stringency of the money market, together with the poor demand for lumber, makes it practically impossible for the owners of the limits affected to secure capital to open up their limits and erect saw mills."

When asked regarding prices, Mr. Anstie said he did not anticipate any advance in the near future. Prices were reduced last January from \$2.50 to \$5 a thousand upon the different grades, which, in his opinion, was an ample recognition of the requirements of circumstances. As to the alleged existence of a feeling of hostility between the coast and mountain lumbermen as to prices, Mr. Anstie said there was always a feeling somewhat of the nature of hostility, although that word was not all descriptive, between competitors for the same market. Beyond that competitive feeling, which had been ear-marked "hostility" by a portion of the press, there was no antagonism between these two branches of the same industry.

New Zealand Demand Growing.

British Columbia lumber manufacturers ought to be interested in the following extract from Mr. J. S. Larke, Canadian Trade Commissioner, at Sydney, New South Wales. He says:

Judging from inquiries and information to hand there is an increased demand for British Columbia timbers in New Zealand, but prices in the United States and Canada seem to have fallen very much, and some recent shipments have been very far below the quotations of the agents of Canadian mills. One representative of British Columbia mills writes:

"I have had a large number of inquiries for timber and several good orders went forward by the last Vancouver mail. There is no doubt in my mind that this timber business is coming to stay as the New Zealand timbers are getting worked out and local millers are rather anxious to preserve the standing timber they have got, as they expect that a greater scarcity will bring much higher prices in the future, and I think they are quite right. In the far south, Oregon pine as yet has not had much chance, as there is a plentitude of white pine, which is considered equally good, but Wellington and Christchurch will buy largely in the future. I have given this business very much attention, but some of the millers are very careless. To give you an idea, some time ago I telegraphed to Vancouver to quote for laths. I received no answer, and consequently this business did not come off. By mail I received the cool reply that the mill had not answered because at the time they were not prepared to ship a million lath. Now, just think of it, not deeming it necessary to answer by cable under such circumstances."

I have frequently called attention to the importance of replying promptly to inquiries of this nature. If they are made by cable, a cable should be sent, even if the business cannot be entertained at the moment. The failure to do so creates a feeling against a dilatory correspondence that would very much interfere with the prospects of business in the future.

Change in B. F. Graham Company.

A change in the ownership of the B. F. Graham Lumber Company, of Victoria, B.C., is reported, the new owners being a number of capitalists from Seattle and New Mexico, namely, J. O. Cameron, D. O. Cameron, Judge A. A. Freeman, J. M. Donahue, L. Scott and M. Pattison, who have purchased the interests of the company at a cost of \$100,000. The property was formerly known as the Taylor-Pattison Mill, and was taken over about a year ago by the B. F. Graham Lumber Company. The transaction just completed practically means a change of the property back again to the old company, which has been reformed by the syndicate comprised of the new owners.

Included in the deal are two million feet of lumber stock, now lying in the yards, and one million feet of logs. The Taylor-Pattison Company will add to their extensive plant and increase their capital stock. A dry kiln is to be built and arrangements made for an in-

creased output. The president of the new company is J. O. Cameron, of Carlsband, New Mexico, a partner of the law firm of Freeman, Cameron & Fulham. Mr. Cameron is a member of the Senate of New Mexico. D. O. Cameron, his brother, is a Texas man. He will be secretary and treasurer of the new company.

J. M. Donahue and Lee Scott are the only members of the company who have been connected with the old company. They are Seattle men who have mill interests there. Mr. J. O. Cameron intends to devote his time to the interests of the lumber company and will not return to the practice of law.

The new mill to be erected by the company will probably be commenced at once. The cost is estimated at about \$150,000. The site was secured some time ago by the company at Thetis cove. A capacity for 100,000 feet per day will be provided for. The mill will take about one year to complete. Mr. Charles L. Bettington, in speaking of the matter, said that the plant when completed would be one of the finest on the coast, and that the situation secured all the advantages that could be desired. It lies between the water and the E. & N. Railway, and facilities for loading the ships at the mills will be arranged for. The company had long contemplated building, and had plans practically perfected at the time of the financial crisis, which caused a delay. At the end of about one year the new mill will be working.

The company will devote itself principally to cutting long timbers, and to secure some of the coast trade that now goes to Vancouver. The B. F. Graham Company control twenty-seven thousand acres of timber limits at Port San Juan and on the San Juan and Gordon rivers, from which the logs for the long timbers will be taken. The deal between the company and the Taylor-Pattison people did not include these limits.

British Columbia Lumber a Necessity.

An article in "Canada" on logging in British Columbia, says it was not until October that the effects of the financial crisis in the United States began to be felt among logging men. News of a comparatively small crop in Manitoba, of a shortage of money there, and of the widening of the commercial anti-cyclone with its centre in New York, came in casual newspapers. Then, suddenly and unexpectedly, the demand for logs died. They became unsaleable at any price. At the end of November all, or nearly all, the camps up and down the coast had shut down. The unemployed loggers poured into the up-country hotels and crowded the steamers going to Vancouver. Vancouver was crowded with "broke" men, who had saved nothing in the boom-time. Some of them refused seven dollars a day in August because of the heat in the high-columned forests. The lesson is obvious enough—there would have been little or no unemployment but for the worker's thoughtlessness and fondness for gambling. It was easy come, easy go, with earned money. The amazing thing is that, at the present moment, the anti-boom has departed whither the boom went. North America must have lumber for house building, and must, willy-nilly, draw on British Columbia's magnificent reserve of timber. Loggers are no longer broke because British Columbia purveys a real necessity of North America living. Canada does not live by bread alone—she is not dependent on wheat—but everything that grows by the will of God.

New Company Formed at Vancouver.

The Western Lumber and Shingle Company has been formed to carry on a wholesale lumber and shingle business in Vancouver, succeeding the Western Lumber Company of which the late W. J. Bannister was the owner. For some time previous to the demise of Mr. Bannister, the business of the old firm was conducted under the management of Mr. Percy G. Sills, and when the Western Lumber Company passed out of existence through the death of its proprietor, Mr. Sills took up the work on his own behalf, under the name of the Western Lumber and Shingle Company. Though a young man, Mr. P. G. Sills has had a long experience in the lumber business, having, in the several years he was connected with the North Pacific Lumber Company, at Barnet, and the Hastings Saw-mill at Vancouver, passed through all the departments of mill work, and obtained a thorough knowledge of lumber, from the log to the finished product. Consequently, he is well equipped to carry on a brokerage business in wholesale lumber.

Associated with him in the new concern, is his father, Mr. Geo. P. Sills, who also has been long engaged in the lumber industry, formerly at Ottawa, and latterly on the Coast. The new company controls the output of several mills on the coast, making a speciality of bridge timber, and rough and dressed lumber, also shingles.

A United States exchange says that it takes an expert to keep up with the rulings of Government officials in British Columbia, and owners of licenses on timber permits need experts to tell them where they stand.

Investing in British Columbia Lumber.

It is expected that next summer, lumber mills will be in operation at Alberni Canal and on Nootka Island. An American firm is reported to be planning operations on an extensive scale, having recently completed the purchase of large tracts of timber there which are to be cruised this summer, logged in the winter and manufactured during the following summer. The parties interested are E. R. and A. Burkholder. The tracts purchased by them include nineteen sections near Alberni Canal and thirty-seven at Nootka Island. The cruisers have been brought from Seattle. The lumber manufactured will be shipped to the mainland coast for transport to the United States.

E. R. and A. Burkholder own a number of retail timber yards throughout Kansas, where the greater portion of the cut will go, to be retailed. The coming scarcity of the product is the reason of the firm's entrance to this territory. Speaking of the purchase Mr. Burkholder said that he had inspected lumber limits throughout Washington and Oregon, but had been unable to find anything suitable at a reasonable price and had consequently come to Vancouver Island. He says that the lumber growing there is the only tall lumber remaining on the continent fit for manufacturing into heavy timbers. He thinks that in a few years the lumber business will become one of the island's most extensive industries.

Mr. Burkholder sees a great future for Vancouver Island. He is one of the many Canadians who years ago migrated to the United States and are returning to the land of their birth for investments. In 1873 a number of farmers from Ontario went across the line and found the settlement now known as Canada Kansas. Owing to the high price to which Ontario farming land rose, these men were forced to seek investments elsewhere and found what they wanted in Kansas. The same difficulty now faces their sons who are leaving the city of their fathers and coming to the Northwest to establish their homes and families. The firm of which Mr. Burkholder is a partner, is also looking into other investments on the island where large sums of capital can be profitably placed, and he says that he knows of no better territory for investing.

Americans Flocking to British Columbia.

A Vancouver despatch says: American lumbermen, literally scores of them, are "taking to the tall timber" in British Columbia. Their eagerness to acquire timber limits and erect saw mills on this side of the line is due to the alleged certainty of the next Congress removing the import duty from foreign manufactured lumber.

Probably the most noteworthy is M. J. Scanlon, of Minneapolis, who, next to Weirhauser, the owner of millions of acres of timber limits in Canada and the United States, is the largest timber limit operator on the continent. He is principal of the firm known as the Scanlon-Brooks Lumber Company. They are now in the interior with a large force of men cruising a vast tract with a view to its purchase, for half a million dollars. It is their intention to erect a saw mill with a capacity of 200,000 feet daily.

W. A. Guthrie, ex-senator, of Indianapolis, who visited Vancouver last winter, has made his first payment on thirteen timber berths on the Squamish at the upper end of Howe Sound. He is buying for investment purposes, and has under operation enormous areas in other places on the coast, Vancouver Island and in the interior. Mr. Guthrie represents Indiana bankers.

The Anglo-American Lumber Company, Vancouver, have been making some extensive changes, having overhauled and remodelled their entire saw mill plant, rearranging the old, and adding new machinery. Part of the new equipment consists of a new slasher table and conveyor system and complete live roll transfer system. The power plant has been increased by the addition of two new boilers, and a new 300 horse-power Corliss engine, supplied by the A. R. Williams Company, of Vancouver. This brings their capacity up to 75,000 feet per ten hours. The Anglo-American Company report that they are finding business picking up, and are looking forward to an early resumption of prosperous conditions in the lumber trade. Mr. Geo. McAfee, formerly with the North Pacific Lumber Company, is now manager of the Anglo-American Company.

The growing importance of Vancouver as a distributing centre is exemplified by the establishment of a branch of H. W. Petrie, Limited, Machinery Manufacturers, Toronto. This branch, which is located at 422 Abbott street, Vancouver, is under the management of Mr. E. Hallman and will look after their entire business in British Columbia. It is the intention to carry a fairly large stock of iron and wood-working machinery in the Vancouver warehouse, including belting and all mill supplies.

Dominion may Investigate Forest Resources.

The question of an export duty upon pulpwood came up again in the Dominion House of Commons on April 29. Mr. E. N. Lewis, M.P. (West Huron), who had previously presented a resolution asking for a committee to consider the question, again urged his point. He did so, he said, because of articles appearing in the press, and because of the action taken by the United States House of Representatives, the Speaker of which had appointed a select committee to investigate into wood pulp and print paper. He asked for the appointment of a committee of the House rather than a Royal Commission, so that the members of the enquiring body would be able to discuss the report in the House. The committee should sit during the recess and report at the next session. Another reason for the step was that the President of the United States had called a congress or convention of the Governors of the different States of the Union to assemble during the coming month of May to discuss the question. He believed that it would be a proper thing for Canada to be represented at that convention, where we could probably get invaluable information. If legislation was enacted, he believed, it could be so framed as not to interfere with the rights or the profits of any of the farmers of Canada, as some feared it would.

In reply to a question by Sir Wilfrid Laurier, as to the points he wished to have investigated Mr. Lewis said the committee should have power, in the first place, as now was the opportunity for doing so, to find out what are the timber and pulpwood resources of the United States, also the resources of Canada, and as to whether the supply is inexhaustible, as had been stated for years; also the visible supply to-day in other countries; also what would be the possible result of an export duty or the adoption of some other means by which the manufacture of the crude product could be carried on in Canada.

Sir Wilfrid Laurier said the question was one which at this moment was engrossing the attention not only of the people of this country, but also of the people of the United States, and which should engross the attention of the whole civilized world. Nothing was more important than the preservation of the forests; but unfortunately, we were all guilty, not in this country, but in all countries, with the exception of very few, of taking the forests too much as a negligible quantity. Mr. Lewis had stated that the opinion was entertained in this country that our timber resources were inexhaustible. This was not his own opinion. On the contrary, he believed that our forest resources were very far from being inexhaustible, and if the present waste went on it was not difficult to foresee that before many years Canada would be very much in want of timber and of wood generally. If the committee had for its primary object the seeking of means and methods whereby the waste of forest lands could be prevented, he would be much in sympathy with it. There was no more important problem than to find ways and means of preserving the forests. In one respect the great enemy of the forest was the railway; another enemy was the fire. Railways had to be built; but whenever a railway was brought into a forest it brought with it the danger of the destruction of the forest itself. He would not be adverse to having either a committee or a commission appointed chiefly for the purpose of finding ways and means to prevent the waste which was taking place annually, not only in this country, but all over the continent.

As to Canada being represented at the convention which had been summoned by President Roosevelt to sit at Washington during the month of May, he said that if they were invited they would be glad to accept the invitation.

The subject which is occupying Mr. Lewis' attention most closely, however, seems to have been overlooked by Sir Wilfrid Laurier. It has reference solely to the pulpwood supply, and involves the imposition of a tariff upon pulpwood. Canadian pulpwood is going into the United States to-day in fairly large quantities to supply work for United States mills. Every cord of pulpwood leaving Canada results in \$6 or \$7 being left in Canada to pay for it. That is all Canadians get out of it. When it reaches the other side of the boundary and is ground into pulp it obtains a value of \$20. Every cord of wood made into fibre has a value of \$30 to \$32. When it is made into paper its value is from \$40 to \$45. Why should Canadians get only the \$6 or \$7, which is the price of the raw material, instead of building up the paper manufacturing industry in Canada and keeping the whole \$45 at home? This is a question for the Government to answer, and if no valid reason can be brought forward for refusing to impose an export tariff, the Government's duty is plain. There is just a tincture of politics in connection with the matter which is alleged to have restrained the Government in the past, and which the advocates of a tariff are afraid may still tie the Government's hands. Some districts in Quebec manage to carry on a fairly lively trade in pulpwood with the United States. From them comes the principal opposition to a tariff. In a recent speech, Mr. Lewis was able to show that of two Quebec towns similarly situated, the one which exported pulpwood failed to grow, and had a stationary revenue from the industry, while the other, which had established a paper mill, had an extensive increase annually, both in numbers and revenue. Outside of Parliament

and of the few localities in Quebec which export pulpwood, the proposal made by Mr. Lewis meets with pretty general support.

Whether intentionally or not, Sir Wilfrid Laurier seems to have side-tracked the issue a little by stating his willingness to appoint a special committee to examine into the whole question of the timber supply, without mentioning in particular the pulpwood issue. The question is so important that it is not likely that it will be allowed to remain unsettled very long. The action of the House of Representatives at Washington in instituting an enquiry into the question of the price of paper, may conceivably result in the Canadian Government being forced to take speedy steps in the matter, especially if the United States Government decides to reduce or abolish the duty on pulpwood.

In the Dominion Senate, Senator Baird has moved a resolution declaring it advisable to appoint a commission of representatives of Provincial Legislatures and other persons concerned with the Crown lands of Canada, to report on the best means for the preservation of forests, in view of the large amount of logs and pulpwood annually exported from Canada. He expressed the opinion that the Dominion should impose an export duty on wood from lands which it controlled. Senator Edwards declared that fire had wrought twenty times' more destruction on Canada's forests than the axe. Had the fire been kept out and the axe used with scientific moderation, as much lumber could have been taken out and the forests would to-day remain practically intact. He did not favor the abrupt checking of the small amount of pulp which was now going from Canada to the United States, claiming that evolution would in a short time transfer the pulp and paper business to Canada.

A few Pointers for Retailers.

Everyone is interested in any kind of scheme for keeping money at home. The following, from the Mississippi Valley Lumberman, upon the point will be read with interest. The writer seems to have been pretty badly abused by some carpenters and so handles them without gloves. But his remarks are worth studying. He says:

When I was running a country yard it was a controlling idea with me to keep all the work at home that I could. I sold the carpenters the material for the making of tanks, for door and window frames, and all such things as could be made at home, thus keeping that much more money for the circulation of the community.

I believe that there are hundreds of country dealers who are to-day as loyal to their home towns in this respect as I was. They, too, are keeping the town carpenters at work refraining to ship in a number of things which they can purchase in a finished state, thus making some of the money which now goes to the carpenter.

In doing this, however, they are doing something which is not generally recognized and appreciated by the men whom they seek to protect. In many instances the carpenters are carrying around a pocket catalogue of mill work sent them by a mail order concern, which they use, either in sending and getting the mill work they need or for the purpose of "jewing down" the dealer on the price of a door or window which they may happen to want for a repair job. There are few carpenters in the country now but what are regularly furnished with these "price beaters," and the dealer who can make a decent profit now from this class of stock is a rare one indeed. There are some carpenters, however, I presume, who are more active than others in this sort of opposition to the interests of the home dealer, and where there are such I would suggest as a counter-irritant that it would serve them as they deserve for the dealer to get in every thing which the carpenter now makes and puts together in his shops, in the "knock down." For instance, you can get in a whole carload of tank material which, being all cut to the proper sizes, is all ready and can be put together by the purchaser himself, or, still better, in slack times, the dealer can have his yard men so employed, and thus have a number of tanks all put up and painted for the farmer as he needs them. The same can be done with door and window frames, both inside and outside. Every bit of cornice stuff and corner boards can be finished at the planer which turns out his flooring. All the extra work needed is for one or both edges to be dressed. It will cost probably not more than 50 cents a thousand and you can get \$1 more for it than for the stuff with the rough edges. By studying up on these things a dealer can get in a good deal of material in a finished state which the carpenter now works up in his shop, as it comes from the pile, and the difference will, in the course of a year, amount to a considerable sum which otherwise would go into the carpenter's pocket. I know this looks pretty tough, but it must be remembered that the carpenter never thinks of the dealer when he is beating him out of a legitimate profit in sending away for what he can buy at home. I'm thinking that a few doses of experience of the kind I have indicated will serve to teach him that there is such a thing as reciprocity in business as well as anything else.

There is no dealer who wants to be at outs with any of his town mechanics. Both parties need each other and should work as much as possible into one another's hands. But sometimes the situation is

afflicted with some cantankerous "wood butcher," who acts as though the lumber yard is there to be operated for his particular benefit. He needs to be taught the lesson of his dependence.

What the country dealer tries to conserve for the town carpenter in this way of keeping what work he can at home is quite the opposite of what the contractor wants here in the city trade. When he has a job on hand and is furnishing the material, he figures every way possible to save the carpenter's time on it, and therefore he gets everything done at the mill that it is possible to do with machinery. Even on the smaller repair jobs this idea is carried out. The other day I sent out some strips on an order that were rough on the edges. This brought a vigorous protest from the contractor because I did not send out those that were dressed all around. He said that he could not afford to pay a man 55 cents an hour to use a plane, and he was right in his position. It happened that I did not know what the strips were for or I would have sent him what he required. Further talk with him on this subject disclosed the fact that the close competition in bidding on jobs compelled him and every other contractor to get the material so finished that it was ready to be simply put together. You don't see carpenter's benches nor large kits of tools on one of these city jobs, because they have no need for them, as everything is already worked out for immediate putting together. The development of the power of the union has brought about this state of things in the wood working trade, what they have gained in the per diem of wages they have lost in the amount of time which they worked under the old regime. The work which they once did has gone from them to be done at the factory by machinery. In bad weather now on a job, the men have to quit for the time being, until it is fit to go to work again. In the old days, the men went to the shop and worked there getting out the cornice and inside finish and such other work as could be done there better than on the job at the building. Since I have been here I have never seen a carpenter ripping a board. His time is too valuable for that sort of work. What do you suppose some of your country carpenters would think and say if all this work should be taken away from them by the lumber dealer who can, if he chooses, furnish everything all ready made and requiring nothing but the work of joining it together.

When I first came here from my country yard I was surprised to see how much was sold of small stock, such as 1 x 1, 1 x 2, 1 x 3 and 2 x 2, 2x3, 3 x 3, all cut from common lumber and S2S only. Then we have the same sizes of better stock and S4S. The ripping of the common stuff costs but very little at the point of shipment. There is a good profit on the sale of it because it is sold in small quantities, and for a man who hasn't a rip saw, it comes handy for him to buy at the yard just the size wanted. Even the carpenter will buy it, because he doesn't like to run a rip saw, if it can be avoided.

The Pulp Tariff at Washington.

A Washington, D.C., despatch says that legislative coercion by newspapers in the matter of the tariff on paper and pulp has not as yet made any headway in the House of Representatives. There are signs that no action will be taken at this session of Congress.

It is the purpose of the special committee of the House to call over forty witnesses. The first witnesses to be examined will confine their evidence to the grievances of the publishers, and after that the committee will go into the increased cost of production to the paper makers. The publishers were disappointed to find that President Roosevelt had not renewed his recommendation that the duty be taken off paper and pulp. He has made this recommendation twice, and then only for the purpose of aiding in preserving the American forests at the expense of the Canadian forests. Since his last recommendation he has approved the platform of the New York Republican State Convention, which declared against the revision of the tariff "by piecemeal" and which was in effect a declaration against the very thing the American Publishers' Association now demands at the hands of Congress.

One witness in his evidence on behalf of the removal of the tariff said that Canadian paper mills were running at this time because American mills had combined to maintain prices at such a high figure that Canadian mills could pay \$6 a ton in freight and still undersell the price which the combination had fixed as its selling basis.

All opinions are not alike regarding the Prairie outlook. Some reports indicate an improvement, but Mr. George F. Gibson, manager of the Pacific coast Mills, Limited, of Vancouver, who has returned from a trip to Alberta and Saskatchewan, reports no prospect of an immediate improvement in trade conditions. The only encouraging feature is that seeding has been early in the Northwest. When a good crop is assured a large business will come to British Columbia mills, as stocks are low and many settlers are coming in.

The tie industry in the interior of British Columbia is expanding. Orders are being placed by the Canadian Pacific Railway for 3,000,000 ties for its eastern lines.

Trade Enquiries.

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of "The Canada Lumberman and Woodworker" may obtain the names of enquirers by writing us. State number of enquiry.

580. Picture moldings.—A Yorkshire firm wants prices for shipments for picture frame moldings. (preferably oak). in all widths up to 4 inches, by $\frac{3}{8}$ and $\frac{7}{8}$ inch thick.

583. Barrel hoops.—A firm of commission merchants in Hull, England, can dispose of shipments of elm, ash, or other hoops for barrels, $5\frac{1}{2}$ and $6\frac{1}{2}$ feet in circumference and shipped thirty to the bundle.

585. Broom squares.—A timber importing firm wants to hear from Canadian shippers of broom handle squares with prices c. i. f., Hull.

602. Picture moulding.—A Barbados firm doing business in picture framing desires prices and catalogues of picture moulding and material for framing from manufacturers in Canada.

603. Picture moulding.—A dealer in picture frames and moulding in Barbados desires prices of cheap moulding and picture frame materials.

605. Chairs.—A Barbados firm wishes catalogues from manufacturers of cheap lines of chairs.

612. Plywood.—A firm of timber importers, making a specialty of 3-plywood, wish to hear from Canadian shippers, with samples, full particulars and prices c.i.f. Hull.

The following untabulated enquiries have also been received and information may be obtained by writing to the "Canada Lumberman and Woodworker," stating particulars of the enquiry.

Embossed wood.—A Canadian firm manufacturing embossed wood mouldings and ornaments, turned art mouldings; interior capitals in wood and composition, and similar lines in woodwork, would be pleased to supply quotations to United Kingdom buyers of these goods.

Spruce Timber Limits.—A Canadian company possessing a fifty years' lease of extensive spruce timber limits, both in Labrador and Newfoundland, with saw mill and power, asks to be placed in correspondence with the United Kingdom firms prepared to negotiate for the purchase of these properties.

Lumber and Sawn Goods.—A firm in Copenhagen, Denmark, would be pleased to hear from Canadian shippers of lumber and sawn goods seeking export trade. They also mention an opening for wooden handles and general turnery.

The Canadian Manufacturers' Association have received the following enquiries for wooden goods during the last two weeks.

1. R. Bleyer, 9 City Chambers, Broad street, Birmingham, England, a large dealer in wooden and hardware with first class connections, and references, desires to hear from Canadian manufacturers of ash and hickory tool handles, broom handles, etc. Has Canadian references and can place good business.

2. Bowring and Company, Export and Import Commission Agents, 17 State street, New York City, have a client in New Zealand who wishes to secure the agency of a first class Canadian furniture manufacturing firm. Canadian furniture into New Zealand enjoys a preference of 12½ per cent.

3. Maxime and Company, Limited, 8-12 Featherstone street, London, E. C., England, one of the largest dealers in wood turnery and joinery in Great Britain, are in the market to purchase these goods in Canada. They are prepared to buy implement, tool, broom, and mop and pick handles of all kinds, shovel trees, dowels mouldings, skewers, closet seats, roll top desks and office furniture, laundry and domestic woodenware, tables, chairs, brackets, wheelbarrows and in fact practically anything made from wood.

Growth of Ottawa Valley Trade.

The lumber trade of the Ottawa Valley is well reviewed from a semi-historical point of view in the American Lumberman, which says:

A decade before Ottawa was chosen as the capital of Canada it had attracted the notice of several enterprising citizens of the United States as a place admirably adapted to become the centre of the greatest lumber industries of the world. Not many years passed before saw-mills sprang up at the Chaudiere, and the virgin forests of the Ottawa valley became an important source of lumber supply for two nations.

J. R. Booth, the veteran lumber king, still active and fired with ambition, came and erected a saw mill greater than ever had been seen there before. In the days when the pines were all stout and lumbermen did not have to handle small logs Mr. Booth could manufacture 150,000,000 feet of lumber in a year.

For a long time E. B. Eddy was a worthy rival of Mr. Booth in the manufacture of lumber, but for many years before his death, last year, he devoted all his energies to matches, paper, indurated fiberware, woodpulp and similar industries. He was the first to utilize the Ottawa river on the Quebec side, and immense works are still carried on there under his name.

Before 1847 lumbering in the Ottawa valley did not amount to much for lack of capital, although the forest wealth seemed inexhaustible. At the same time in the Adirondacks, across the international line, lumbering was in a flourishing condition. But there were many adventurous men who were not afraid to come into the new fields of Canada for the greater rewards that were offered, for they had heard of the magnificent Chaudiere and the vast acreage of pine in the adjacent territory.

H. F. Bronson, whose name was afterwards given to one of the Ottawa saw mills, was the first of these outsiders to explore the Ottawa valley. He built a mill at the Chaudiere in 1853, and soon began to export lumber into the United States.

The father of direct buying in Ottawa for the British market was Robert Cox, who started making small purchases thirty-five years ago. He is in Ottawa today, doing similar business on a much smaller scale.

In many of its branches the lumber industry has been revolutionized within the memory of the sons of the old lumber kings. For instance, the making of square timbers, which used to be floated down the Ottawa and St. Lawrence rivers in numerous big rafts, is an in-

dustry which has dwindled almost to nothing. Nearly all the export trade used to be in square timbers and deals, but now the lumber is cut finer and a larger portion is sold to the United States.

In 1890, 11,000,000 feet of square timbers were shipped from Quebec, while last year the quantity was only a little over 2,000,000. These statistics were affected greatly by the production in the Ottawa valley. It would be difficult to estimate whether the total production in the Ottawa valley is less than it was twenty years ago. The number of lumber mills at the Chaudiere that have been replaced by other industries is ample proof that the output of lumber in the immediate vicinity of Ottawa has decreased. To offset this a large number of small mills have been built on tributaries of the main stream, the capacity of many mills in the Ottawa valley towns has been enlarged, and new mills have been established in following the cut of the forest, because the constantly advancing price of labor made it desirable to lessen the handling of logs as much as possible.

The depletion of the forest has changed the character of the lumber industry more than anything else. When large pine trees were plentiful it did not pay the manufacturer to handle small logs, or to bother much with spruce or hemlock, but operations are conducted on a different plan now. Trees that would have been culled out eight or ten years ago are considered a valuable part of the limit, and the Ottawa mills are all cutting spruce, which has come to rank closely to pine as building material.

A good cut of spruce, says the experienced lumberman, is worth as much as a bad cut of pine. The best grade of spruce is now selling from the manufacturer to the wholesaler at \$24 a thousand, which is about as good a price as can be got for pine shipping culls. The sawing of hardwoods is also a comparatively new branch of the trade in the Ottawa district.

Nothing else has happened in recent times to attract so much attention to the Ottawa lumber industry as the advance in prices. In the spring of 1906 contracts were closed with British and American buyers at a 10 per cent. advance. Manufacturers learned that their rates were too low because, before the season was over, nearly every line of lumber had advanced \$4 or \$5 a thousand. Low water, which interfered with the drive and kept some mills from operating for want of logs, while other mills had to close because of defective water power, reduced the lumber output in Ottawa so that the present year thus far has witnessed a still further advance in price.

The market in Ottawa, however, is experiencing only the buoyancy which characterizes the lumber trade all over the world. The reason for soaring prices notwithstanding the greater use of other building materials, such as iron and concrete, is that the consumption of timber is increasing while the forests are diminishing. Such heavy shipments of pine were made to New York and Montreal from Ottawa yards this spring that they are nearly bare of dry stock.

Lumbermen say that they are making no more money at the increased rates. It is pointed out that the limits are more expensive. A sale took place not long ago when the Ontario government received \$10 a thousand for lumber on the stump. Not many years ago this would have been a reasonable price for the manufactured product. The necessity of sawing smaller logs adds greatly to the cost of manufacture, and shanty operations become more costly, accordingly as the lumbermen go farther into the woods for timber. Men demand better treatment than in the earlier days of lumbering, and the maintenance of a lumber camp is at least twice as expensive as when the first mills were erected in Ottawa. The addition to men's wages in all branches of the industry is another important item which reduces the lumbermen's profits.

Lumbering on the Ottawa river is carried on in such a way that the manufacturer has his money invested from two to three years before he gets any return. The logs which Mr. Booth is now cutting and which will keep his mill going all summer were taken out winter before last. From experience he has found that it is necessary, owing to delays in the drive, to keep a year's cut ahead. One company manufacturing in Ottawa is nearly two years ahead, and is still uneasy lest the drive should not be steady enough to keep the mill going all summer. Indeed, the lumbermen make no apology for the recent big advances in lumber, and they need not, for orders are far heavier than can be filled.

Half a billion feet of lumber is an average for the Ottawa valley each year. An estimate of the quantities shipped by the chief manufacturers last year—which, by the way, was a little below the average—is as follows: J. R. Booth, 85,000,000 feet; W. C. Edwards Company, 75,000,000 feet; Gilmour and Hughson, 25,000,000; Hull Lumber Company, 3,000,000; R. and T. Ritchie, 13,000,000; Rideau Lumber Company, 8,000,000; Shepard and Morse Lumber Company, 22,000,000; Fraser and Company, 20,000,000; estate of R. Hurdman, 5,000,000.

Lumber shipments over the Great Lakes for the calendar year 1907 are estimated to have amounted to 1,380,284,000 feet, against 1,807,570,000 feet in 1906, a difference of 427,286,000 feet.

N. S. Hardwood Cut to be Reduced.

Secretary Lewis Doster, of the Hardwood Manufacturers' Association of the United States has returned from an extended trip to many of the large river and mountain mills in Tennessee, Kentucky, West Virginia and Ohio, and to the hardwood dealers and consumers in the principal Eastern cities. He sees in the improved financial outlook much of encouragement for the lumberman. In an interview, he says a great many of the mountain mills which were shut down in the winter have begun running on half time. This product will hardly be increased. Some mills, which have not yet started, will hardly begin operations, owing to the fact that the river mills have so much production to take care of the trade for this season. The tendency is to do as little business as possible in selling, at prices which are now being offered, as they are below the cost of production, based on the natural price of stumpage. The latter has not decreased to any extent during the monetary depression. A great many firms are arranging to put in more piling ground to avoid being forced to sell on account of the lack of space.

In the Ohio river section this is looked upon as a year of large log receipts, and it will be the last large one for some time. Even, though, in digesting this large receipt, only two mills out of all those operating will be in operation in thirty days from now. This section will make every effort to pile lumber in the most systematic manner, the majority of it being "dead-piled," after it has remained on sticks for a minimum period of six months, properly protected from the weather with roofing boards. In this way it can be easily held for twelve months or more without damage. There are two reasons for this action. One is that there is no satisfactory market at present, compared with the cost of production,—the timber for this year's run out was all high-price timber for the good quality logs, having been contracted for during the year 1907. The other is that there will be no river mills operating in the woods this year. It is estimated by conservative people that only from fifteen to twenty per cent of the usual supply will be available in logs coming out by the tide next year in this district.

This seems rather a peculiar statement, but it is a fact that such a condition will exist, for at no place is there any logging going on now, nor will there be except by a few firms which are forced by contract on certain land to cut timber. These conditions will make up the fifteen to twenty per cent. as stated.

The opportunity for the mountain millmen next year will be most apparent at that time; the benefits which they will receive then by lack of river production will be felt, as they will be in the "lime light" of trade, and will be able to fill the wants of the trade more satisfactorily than any one else.

The consumers of lumber are working down to practically the end of their stock, and they are only ordering a car load at a time,—for rush shipments at that, to keep their machinery going, and there is some business being obtained under such conditions.

The values of hardwoods, of course, cannot be lowered to any extent, as it seems that of other woods have been. Production is too light; the area of raw material is too visibly decreased, and the least indication of any appearance of trade will bring conditions very close in line with the values of the past.

Quartered oak is in very large demand. Red oak now seems to be foremost in this class of material. Planing mill stocks are moving in good demand, and no accumulations are reported at any point. The box makers are busy, and will take during the year plenty of the low grades.

In the market statement issued by the Hardwood Manufacturers' Association there are very few changes in prices.

Barbados advices, dated April 27, from S. P. Musson, Son & Company, say that the only arrival of lumber during the fortnight is by the schooner "G. R. Alston," from St. John, N.B., with 97 m. ft. white pine, principally second quality, which was sold at \$29 for merchantable, and \$22.50 for second quality, and as stocks are getting used up, one or two small cargoes would fetch in the neighborhood of these prices. The market is still heavily stocked with spruce and hemlock, and we do not see any opening for a cargo just yet. Pitch Pine—no arrivals. Shingles—the schooner "Moravia" arrived from Halifax, N.S., with 1,170,000 cedar laying, which had been sold to arrive some time ago at \$2.05, and we learn of one or two cargoes now on the way, which should fetch similar prices, as market is lightly stocked. There have been no receipts of long Gaspe, and as there are no stocks of these, first arrivals should do well. Shooks—no arrivals, but supplies are ample. Wood hoops—receipts consist of 250 bds. by the "Salybia," imported by a dealer.

Canada has over 20 million acres set apart as forest reserves, among which are: Ontario, 11 1-2 million acres; Quebec, 1,620,000 acres; Manitoba, 2,289,787 acres. Canada has 120 species of native trees.

Canadian Timber Supply.

In a report on the Canadian timber average, The American Lumberman says: the estimate made by Mr. Treadwell Cleveland, jr., of the United States Forest Service, is even lower than that by Mr. B. E. Fernow, Dean of Forestry at the University of Toronto, who placed it at 300,000,000 acres. Mr. Cleveland places Canada's acreage, stocked with good commercial timber, as at present not exceeding 260,000,000 acres, a strangely low estimate when Canada's official figures give the forest area of the province of Quebec alone at 209,000,000 acres, not, however, all stocked with good commercial timber. Mr. Cleveland asserts that Canada does not possess much more than 50 per cent. of the quantity of good timber still to be cut in the United States, although the former is exporting twice as much as the United States. In other words, Canada is in that respect using up twice as much of its timber resources as is the United States. To convey a rough idea of the supposed value of the timber lands of Canada, it may be stated that a rough estimate, said to be conservative, of the value of Quebec's forest area, 209,741,000 acres, or 327,721 square miles, is \$2,709,327,692.

There is one point upon which none of the experts can differ—namely, the necessity of dealing with the forests of the country on business principles, and soon. Even Russia shows an example of thriftiness and progressiveness in the management of its timber areas that by comparison puts the successive governments, since confederation, to shame. Russia's forests in Europe and Asia combined are said to exceed 900,000,000 acres. Under a system of timber lands administration adopted many years ago, and since rigidly adhered to, the Russian treasury derives an annual income averaging about \$21,000,000 yearly from her forests. Finland exports \$20,000,000 worth of timber yearly, and no timber less than ten inches in diameter twenty feet from the ground can be cut. Sweden has nearly 50,000,000 acres of forest and ranks second to Russia as an exporter of timber, selling \$54,000,000 worth of timber abroad, of which England takes nearly \$30,000,000 worth. France is carrying on a splendid scheme for the regulation of cutting, planting and fire protection. Canada is moving in the same direction, and in the United States President Roosevelt is doing the same, as witness the calling of all the governors of the various states to a conference this month.

Not So Dark As Some People Think.

Not long ago, Mr. J. F. Whiston, of the surveys branch of the department of lands and forests of Ontario, made the statement that within twenty years a pine famine would be suffered unless precautions were taken to limit the cut. A prominent Ottawa lumber merchant recently said that he thought the statement rather exaggerated. "If accurate knowledge could be obtained as to the exact amount of white pine now standing, he said, it would be possible to form an estimate of the length of time which the pine would last at the present rate of consumption, and whether there was any danger of a timber famine. Present estimates, however, are formed chiefly on guesswork. I think also that Mr. Whiston had not taken into consideration the relief being now furnished white pine by other varieties such as spruce, North Carolina pine and yellow pine. I think that on the whole Mr. Whiston's is a far cry." The opinion of Mr. Wm. Anderson manager for J. R. Booth, Ottawa, on the subject is also valuable. He is reported to have said that he thought Mr. Whiston had colored matters somewhat highly, and that there was little danger of timber famine if the forests were properly protected. He said that Mr. Booth was spending more and more every year in protecting his immense timber areas and he felt pretty sure that nearly all other lumbermen were doing likewise.

Creosoting Douglas Fir.

David Allerton, in a paper read before the United States Wood Preservers' Association, says: Douglas fir varies in its structural condition of fibre, is very refractory to treatment, and is injured by high temperature or long continued steaming, and in treating a number of pieces there will be considerable difference in penetration. In sawed timber much of this difference is due to the mode of sawing. The timber has a hard and soft side; in one a penetration of perhaps an inch is obtained and in the other twice as much. In seasoned fir piling some pieces of the same charge will show 2 inches and some 4½ inches. The penetration varies also in different parts of the same pile.

To treat seasoned timber without steaming, the cylinders must contain steam pipes to keep the solution hot and to bring the wood up to the same temperature, and the pressure must be gradual. If this process is followed the impregnation will be as thorough as if the wood were steamed, and there will be no subsequent drip.

The method in the case of seasoned fir is to place the wood in a sealed retort and to turn the steam into the coils, the creosote being introduced at a temperature of 170 degrees F. Time is allowed for

the exterior of the wood to become of equal temperature with the oil (about an hour), the temperature during the process being kept at 175 degrees to 180 degrees F. Pressure is started very gradually to allow the injected oil to follow the expanded and heated cells; for if the pressure were suddenly raised the contraction of the outer fibre would effectually stop absorption, opposing, as it were, a dead wall. By gradually increasing the pressure the oil in the expanding cells is forced still farther in. In this way a penetration in seasoned fir of 2 to 4½ inches in piling, the treatment taking 12 to 14 hours is obtained.

Green fir treatment by the "open tank" method consists of two treatments. The preliminary treatment is the same as for seasoned fir, except that the water in the wood being expanded and replaced by the heavier creosote, and rising to the top of the retort, is drawn off through a standpipe connected with a ¼ inch pipe and valve. After 12 hours' pressure the oil is drawn off and the wood and retort cooled for 12 hours, when the process is repeated, another gradual pressure being maintained for 12 hours. We find that we inject the most oil in the first 12 hours, but get penetration in the second 12 hours. The average penetration is 1 to 2 inches. This process, with inferior results and consuming 36 hours, is not desirable unless necessary. Both processes require the supervision of an expert or skilled help, for if temperature and pressure are not properly regulated the result will not be satisfactory.

The principle involved in this mode of treatment is to have the wood warmed to as near as possible the temperature of the fluid to be injected. It is apparent that the attempt to force a hot solution into cold, refractory wood must result in failure, but by giving the wood time to expand and the heat time to penetrate toward the centre of the timber it is found that the fluid is gradually forced in, in proportion as the interior heat increases.

Dodge Power Transmission Goods.

The Dodge Manufacturing Company of Toronto, have issued a condensed price list, No. 27, relating to their power transmission goods. There seems to be nothing in the line of wood-split solid or split-iron pulleys which they do not produce in the very best grades. Other products described are split friction clutches and cut-off couplings, adjustable floor stands for electrical jack shafts and water works service, pillow blocks, rigid post boxes, ball and socket post hangers, drop hangers, shafting and appurtenances, rope sheaves for transmission of power, manilla rope, rope dressing, rope drive appliances, sprocket wheels, screw conveyers detachable link belting, solid cotton belting, belt conveyor appliances, etc. Some useful information is contained in the list, such as a simple rule for ascertaining the transmitting power of belting, without first computing the speed per minute that it travels. The method is as follows: Multiply the diameter of the pulley in inches by its number of revolutions per minute, and this product by the width of the belt in inches. Divide this product by 3,300 for single belt, or by 2,100 for double belt, and the quotient will be the amount of horse power that can be safely transmitted.

The Dodge Manufacturing Company contracts to equip grain elevators complete and to install complete power transmission equipments for any size of plant. Their engineer when desired, assists in the laying out of outfits. They have equipped many of the largest water power plants in the country. One of their specialties is designing and erecting rope drives of any horse power to meet every requirement. Their belt conveyors are used to convey coal, stone, salt, cement, cinders, gravel and dirt and many of their installations as high as 600 feet centres are now in successful operation.

Boom Broke at Buckingham.

As a result of the high water in the Lievre river at Buckingham, Que., the immense boom of the James MacLaren Company, which is stretched across the river, gave way recently and allowed 30,000 logs to be carried down the rapids towards the Ottawa river. The boom was for the purpose of holding the logs as they came down the river until they could be conveyed to the saw mill, and in the neighborhood of 100,000 logs were being retained. One of the posts on the shore gave way. Immediately upon the breaking of the boom, men were stationed at the mouth of the river, where it empties into the Ottawa, to prevent the logs from getting loose in the Ottawa, in which case it would be a difficult task to round them up. As it is, however, great difficulty will be experienced in bringing them back to Buckingham to the saw mills. A great number of the logs will stick on the numerous rapids.

The Western Oil & Supply Company, Limited, have supplied the complete belting equipment for the new Barnet-McDonald shingle mill at New Westminster. This installation includes the main drive belt, which is 27 inches wide and 7 ply thick, made by the Durham Rubber Company.

THE WOODWORKER

Increased Use of Sanding Machines.

A feature of modern progress in woodworking, says an exchange, especially in relation to the employment of machinery, has been the development of machine sanding. Sanding machines as part of the equipment of planing mills and furniture factories have been in use for many years, but during the last decade not only has decided improvement taken place in the older types of sanding machines but a varied list of new machines for sanding woodwork of different kinds and shapes has been invented.

The earlier types of sanders, while they took out the marks made by the planer, frequently left the finished material with disfiguring sand marks so that when a really smooth job was desired it became necessary to go over the work by hand and laboriously rub out the marks with finer sandpaper.

The older types of sanders have been much improved, so that they can be carefully adjusted, and the back cylinder, being covered with fine sandpaper, takes off much of the marketing of the front cylinders. The adjustment has been carefully worked out for finer manipulation, and in every respect the improvement in the cylinder type of sander alone has been great. Besides this, many useful special machines have been designed and built so that the man doing enough work of any one kind can so equip his plant that practically all the sanding can be done by machinery.

A special machine has been designed for sanding doors, by means of which each piece of the frame can be sanded the right way of the grain and be given a very fine finish. Single drum sanders have been improved by special adjustments so that, in the hands of an accomplished operator, they will perform a wide range of work. Special machines are made by enterprising woodworking machinery men for every purpose imaginable, and many progressive factories and planing mills have developed special sanding machines of their own design to fit some peculiar requirement. Improvement in woodworking machinery development is only beginning and there is now more call for better finish.

This item of sanding is an important one, to which a few years ago but little attention was paid. Now it is recognized that to sand off by hand and finish up large quantities of woodwork involves much tedious labor and expense. The modern sanding machine is one of the greatest labor saving devices we have and stands in about the same relation to the hand sander as the cabinet planer does to the man dressing lumber with the old fashioned hand smoothing plane. Altogether these modern sanders are of so much importance that the up-to-date planing mill or furniture factory is not complete, and probably not able to compete with some of its neighbors, unless it includes in its equipment some of the modern types of sanding machines peculiarly adapted for the work they have to do.

Bent Rims V. Sawed Fellies.

The bent wood rim will probably never entirely replace the sawed felly in all classes of vehicle work, but it has already made great inroads in that part of the wagon trade which was formerly supplied almost exclusively by sawed fellies, says The American Lumberman. It is proper that it should, too, because its manufacture is a step forward in wood economy, though it involves the use of a better grade of material than is required to make the sawed felly. The bent rim has been the ideal rim with the woodworkers for many years and has been used continually. It is made of hickory, mostly, although oak is used to some extent in the manufacture of buggies and carriages. The earlier efforts to use it for waggon wheels were not entirely satisfactory, however, and like many other ideals, the bent wood rim had its hold-backs. The fault found with it in the earlier days was that after being put in use it had a tendency to split and spread out where the spokes were set in. This gave so much trouble that it was discontinued in the making of waggon wheels and heavy vehicles and only in recent years has any appreciable development been seen in this work. Now, however, it is used in larger quantities and greater variety of sizes.

Manufacturers have learned how to do the bending better and have come to understand that wood bending is a wood compressing process. Therefore the wood is carefully steamed and properly compressed so that when dry it does not spread open or split. It can be made at a reasonable cost in any width of tire from one to six or eight inches, whereas to make a wide tire, with a sawed felly, is an expensive undertaking. The timber required to make a set of six inch sawed fellies would easily make three sets of bent rims of the same size, and the time required to make them would be less. The bent rim requires

practically clear stock, however. Knots and cross grains can not be used. One must have a clear stick of the dimensions required to make half the circumference of the wheel if a bent rim is desired.

The bent rim of which the foregoing is most specifically true is the oak rim for waggon wheels and other heavy vehicles. Business in bent hickory rims for light vehicles has continued practically the same for years, fluctuating only with the amount of carriages, etc., made. Many sawed fellies are still made, but this branch of the trade has been cut into so heavily by bent work, that it is not likely to increase, because, while sawed fellies can be made from scrap materials, the process is wasteful as compared with that of bending.

Sash and Door Improvement.

The American Lumberman of May 2nd says that the sash, door and millwork trade has shown some improvement during the last few days but the state of the market is such as to indicate a fear among the retailers which precludes their stocking up to any considerable extent. The number of orders received by most manufacturers during the last week was equal to the best previous week in the year and in some instances more orders were received than during any previous week. The volume of business, however, was not as great as might have been expected, in nearly every instance the demand being for small lots to supply immediate needs. The call for stock goods has been very light. The manufacturers feel that this situation will continue for a time and anticipate enough orders for special stock to keep their plants running. The feeling of unrest in the east which for some time has permeated the lumber trade seems to apply equally to sash and doors and that part of the country is returning comparatively poor dividends at present. The factories continue to operate on the same basis as heretofore, and while the demand for special stock continues will continue gradually to reduce their holdings of stock sizes so that when the lull comes they will be able to devote themselves for a time to replenishing their old stock.

The Lathe as a Box Machine.

It is likely, if the history on the subject of the lathe were looked up, says the London Timber News, it would be found that the first machine-made box was made on the turning lathe. The turning lathe was probably the first woodworking machine invented. Boxes were made before the times of machinery and probably before the time of the lathe, but it is more than doubtful if boxes were made by machinery in any other manner earlier than they were made on the turning lathe. The main product of the lathe in the box line is small boxes for a great variety of purposes. One and probably the original type of large quantity was the pill box, in which both the box and lid were turned, with the lid fitting neatly on the boxes. There are quite a number of boxes of this type made today for various purposes, especially in connection with drug store supplies and for many other articles in the novelty class, that are wooden boxes. Some are plain turned, some neatly polished and varnished, and some turned in various designs. It would be difficult indeed to get a complete line on the wide variation or quantity of boxes made on the turning lathe, but if the data could be gathered and the array of boxes displayed in pictorial form, it would present not only an interesting feature, but quite an aggregate amount of work that might properly be classed with boxes.

A report in the Toronto papers to the effect that woodworking employers were considering a reduction of the hours of work from 9 to 8, without any reduction in wages, is unfounded. It originated in a reduction of time from 9 to 8 hours in the factory of Mr. G. G. Miles, Parkdale, Toronto. This reduction did not result in the employees getting the same pay as before. They are still being paid at the former rate, and will therefor get only eight-ninths of the former amount. Mr. Miles reduced the working time, because of a slight falling off in orders. He reports, however, that business is picking up nicely again now. Orders are fairly numerous, but prices are lower than formerly. The building trade, he says, is becoming quite active. Other Toronto firms report the same conditions.

Fort Frances, Ont., has aspirations as a manufacturing centre. It is situated in a country which possesses valuable pine limits, and it is in the making of lumber goods that Fort Frances hopes to excel.

A Bad Time for the Dokis Sale.

In the House of Commons recently Mr. Perley, M.P., referred to the impending sale by the Government of the timber on the Dokis Indian reserve on the French River. He told the Government that they should not bring on the sale at the present time, as the conditions of the lumber market were so unsettled that they could not possibly obtain a good price for the timber. He also pointed out that insufficient time was being given to examine the limits, as the sale was to take place on June 24. The current opinion of lumbermen was that the Government would be acting foolishly if they sold the limit now. Hon. Mr. Oliver, Minister of the Interior, was not in the House at the time, and no official answer was obtained to Mr. Perley's remarks, nor has one since been given. In referring to this matter in our last issue mention was made of the fact that under the ordinary law, the logs cut on this reserve, being under Dominion jurisdiction, could be exported to the United States, although on account of the superior facilities for manufacturing in Ontario there was no probability of

this occurring. In this case, however, it appears that the Dominion Government has fallen in with the Ontario custom, and has made it one of the conditions of the sale, that the logs cannot be exported to the United States.

The University Forestry Quarterly, Vol. VI., No. 1. has just been issued. It will be found unusually interesting to lumbermen. An extensive article upon "Logging by Steam" is included, which gives an account of the methods of wire rope logging, generally called steam logging, in such a manner as to enable lumbermen to judge of the suitability of these methods to their own conditions. Among the other articles are: "Notes on the Girard Estate," by Jay F. Bond; "The Management of Spruce and Hemlock Lands in West Virginia," by Max Rothkugee; "Extending a Log Rule," by Edward A. Braniff; "Philippine Woods," by C. H. Goetz. Current and periodical literature, and news reports are also well dealt with.

One writes: "We put the small circular on the mandrel on the 7th inst. and have used it since until yesterday. It started off like a top, and is in excellent condition. We put on your new 60-inch saw yesterday and it started up the best of any saw we ever put on. We are cutting large logs to-day and it cuts to perfection and must thank you for the sending of these saws in such grand condition."

4 refitted sash stickers complete.
2 new foot-power mortisers.
2 refitted power mortisers complete.
3 new No. 3 Fox foot-power mitre machines.
1 new Cowan hand mitre machine.
1 30" revolving bed, double surface planer complete.
1 27" revolving bed, double surface planer.
1 27" divided roll double surface planer.
1 26" Cowan revolving bed, double surface planer.
3 refitted 24" surface planers.
1 refitted 24" revo ving bed, surface planer.
1 new 24" pony planer with countershaft.
2 refitted 24" double surface planers.
1 refitted 24" double surface planer and matcher.
1 new 24" Cowan planer and matcher.
1 rebuilt 24" Cowan planer and matcher.
1 refitted 23" wood frame surface planer.
1 new 18" Little Giant planer and matcher.
1 nearly new 13" heading planer.
1 nearly new 13" lightning flooring machine.
1 refitted 12" flooring machine.
1 nearly new 24" buzz planer with countershaft.
5 new 16" buzz planers with countershafts.
10 new 12" buzz planers with countershafts.
2 refitted horizontal boring machines.
2 new post boring machines.
4 new two spindle wood shapers.
2 refitted single spindle wood shapers.
1 new saw arbors (No. 1 to No 4)
1 new dimension saw table.
1 new feed rip saw table.
1 new new combination roller top saw table.
2 new No. 1 Crescent saw tables.
1 improved rip saw table in good order.
1 Cowan combined saw table and dado machine.
4 nearly new variety saw tables.
2 new iron frame swing cut-off saws.
3 refitted iron frame swing cut-off saws.
1 new gravity swing cut-off saw.
1 new 36" pedestal band sawing machine.
1 new Crescent panel band sawing machine.
2 refitted 54" band resawing machines.
2 refitted 40" circular resawing machines.
1 nearly new 32" disc sander, with boring attachment.
1 refitted 24" single drum sander.
1 new Cowan door clamp, with sash attachment.
1 new No. 2 tenon machine, with double copes.
5 new Fox wood trimmers.
1 refitted horizontal band carving machine.
1 nearly new Cowan filing machine.
50 new No. 3 Palmer patent glueing clamps.
1 new Dominion hand saw set.
A copy of our supply catalogue or monthly stock list for the asking.

AUCTION SALE

— OF —

VALUABLE TIMBER LIMITS, SAW MILL,

Plant, Supplies, Mining Lots, Logs, &c.

— OF —

THE EAST TEMPLETON LUMBER COMPANY, LIMITED.

There will be sold by Public Auction, at the Russell House, in the City of Ottawa, on Tuesday, the 15th day of September, A.D. 1908, at 2.30 o'clock p.m., by THE EAST TEMPLETON LUMBER COMPANY, LIMITED, the following Timber Limits, Real Estates, Saw Mill, Mining Lots, Plants, Supplies and Logs in transit, namely:—

Parcel Number 1. "Coulange Limits," comprising 156 square miles of Timber Limits on the Coulange River in the Province of Quebec, covered by Licenses Numbers 149, 150, 151 and 152 of Season 1873-74 and known as Berths W, X, Y and Z, together with certain Limit Plant, Supplies and Live Stock to be sold therewith.

Parcel Number 2. "Hibou Limit (Gatineau)," comprising 20 square miles of Timber Limit on Hibou and Ignace Creeks covered by part of License No. 550 of Season 1873-74, together with certain Limit Plant and Supplies to be sold therewith.

Parcel Number 3. "Wakefield Limit (Gatineau)," comprising 8 square miles of Timber Limit in the Township of Wakefield covered by License No. 58 of Season 1873-74.

Parcel Number 4. Several Freehold Timber Lots in the Township of Wakefield.

Parcel Number 5. "Black and Dumoine Rivers Limit," comprising 26½ square miles of Timber Limit on the Black and Dumoine Rivers covered by part of Licenses Number 362 and 366 of Season 1873-74 together with certain Limit Plant and Supplies therewith.

Parcel Number 6. Real Estate, Saw Mill, Lumber Yard and Wharf at East Templeton. This parcel consists of about 208 acres more or less of Freehold and 5 acres of Leasehold land at East Templeton, P.Q. (about 8 miles below Ottawa on the Ottawa River), together with a fully equipped Saw Mill and Machinery erected thereon having a capacity of 150,000 feet per day, with Lumber yard, Wharf, Railway siding, Cars and other plant and machinery therewith.

Parcel Number 7. Mining Lots. This parcel consists of several mining lots and mining rights in the Townships of Wakefield, Buckingham, Portland East, Portland West and Derry.

Parcel Number 8. A large quantity of logs, timber, telegraph poles and ties now lying in and about the Ottawa, Coulange and Gatineau Rivers at and in transit to the above mentioned Saw Mill.

The first seven parcels above mentioned will first be offered for sale en bloc, subject to a reserved bid fixed by the Vendors. If the reserved bid is not reached, then each parcel will be immediately offered or sale, separately, subject to a reserved bid fixed by the Vendors.

Full particulars and complete descriptions of the respective parcels and the terms and conditions of sale will be made known at the time of sale and may be seen on application to the Vendors at East Templeton, P.Q., or to their Solicitors, Messrs. Gormully, Orde & Powell, No. 33 Sparks Street, Ottawa

THE EAST TEMPLETON LUMBER COMPANY, LIMITED,
Vendors.

Dated this 3rd day of March, 1908.

WE ARE OPEN TO CONTRACT FOR CUT- ting of lumber by the thousand in any quantity from one million to one hundred million feet.

SOUTH RIVER LUMBER COMPANY, Limited
South River, Ont. 10

B. C. TIMBER AND TIMBER LANDS.

I HAVE FOR SALE, SOME OF THE FINEST tracts of Timber in British Columbia, principally Spruce, Fir and Cedar, ranging from 2,000 to 140,000 acres, mostly on tide water, and easily logged. Prices from \$1.00 to \$9.00 per acre. State your wants: I will supply them. W. H. LEMKE, P.O. Box 972, Vancouver, B.C. 9

New Shingle Company For New Brunswick.

The Nepisquit Lumber Company, an organization of Springfield capitalists, for the purpose of cutting and manufacturing cedar shingles in New Brunswick, has been organized under the laws of New Brunswick. The officers are: President, Ralph W. Ellis; vice-president, Charles D. Irdway, of Burlington, Vt., president of the Vermont Spool & Bobbin Company; treasurer, Fred. S. Morse; secretary, Alexander W. MacRae, St. John, N.B.; assistant secretary, Edward A. Appleton, Springfield; directors, Ralph W. Ellis, Fred. S. Morse, Samuel Greene, Edward O. Sutton, Springfield, and Charles A. Barton and William G. White, of New Brunswick. Mr. White will be resident manager for the company. In addition to the board of directors there will be a board of management, made up of local stockholders, who will act in conjunction with the directors in the government of the company.

It is said by one of the members of the company that all of the cedar timber in the United States has been exhausted and that New Brunswick is one of the few remaining places within easy access where it can be procured. The company will devote all of its attention to the manufacturing of cedar shingles for which there is a great demand. It has bought cedar rights for about 500 miles along the Nepisquit and Nigadoo rivers and has already about 5,000,000 feet of cedar ready to be floated down to the mill as soon as the rivers open. The mill is in place and eight shingle machines have been installed.

Dominion Will Pay The Bill.

It is understood that the Dominion Government will immediately take into consideration the advisability of appointing a number of fire wardens to do duty along the line of the Transcontinental Railway in New Brunswick as the present location runs through no less than 180 miles of forest lands in that province, 85 miles belonging to the provincial Government, 65

miles to the New Brunswick Railway Company, 20 miles to the Gibson Lumber Company, and the balance to the Mirimichi Lumber Company.

Hon. J. Douglas Hazen, premier and attorney general of New Brunswick, accompanied by the Hon. C. Hazen Grimmer, surveyor general, and Col. Hugh H. McLean, K.C., representing the New Brunswick Railway and the Gibson interests, interviewed Sir Wilfrid Laurier, Hon. George Graham minister of Railways and Canals, and Hon. Wm. Pugsley, Minister of Public Works, recently as to the advisability of appointing a number of fire wardens.

The Premier of New Brunswick stated how important it was that the federal authorities should establish as perfect a protection as possible from fire during the construction of the road. Hon. Mr. Hazen also assured the Prime Minister and his colleagues that if such nominations are made the New Brunswick authorities would be most happy to clothe them with all necessary power. Premier Hazen and his colleague state that they were under the impression that the federal ministry will take steps to carry the suggestion into effect. For the last two years the Federal Government has granted \$3,000 per year to pay the salaries of fire rangers along the portion of the National Railway under construction in New Brunswick. This year a much larger area will need to be protected, and the cost of adequate fire protection will be between \$20,000 and \$25,000.

Not So Rosy Down East.

A despatch from St. John, N.B. says that according to a prominent St. John lumberman, the lumber industry in this city will be in as poor shape the coming summer as it has been for a long time. The present state of the British and American markets is such, he said, that there is not a great deal of encouragement in manufacturing. There does not appear any great prospect for an improvement. White Sea and Baltic goods have taken the bottom out of the British market, and are down to prices that make shipment out of the question so far as making money is concerned.

Ship building and house building are very dull, making the demand much less than ordinary. There is a fair supply of logs on hand and a good quantity to come down the river. The conditions for driving are giving promise of being very favorable. All that is now required in this regard is a little warm weather to swell the river and streams.

One mill owner is reported to have said that he did not purpose cutting any more logs this season unless things looked up. It was impossible to get the cost of manufacture at the present time. He was uncertain whether his mill

would be working this summer, but thought it unlikely unless there was some improvement.

The manager for Stetson, Cutler and Company, also spoke of the poor state of the lumber markets. He declined to say what the supply of logs on hand was or what was expected, but was uncertain as to whether the mills would be running during the summer.

British Columbias' New Pulp Mill Progressing.

The big saw mill of the Canadian Pacific Sulphite Pulp & Paper Company at Swanson Bay is now running by water power. The company is proceeding steadily with the construction of its plant at Swanson Bay, and a great deal of work has already been completed. It will be the fall of this year before pulp making is in progress, according to the expectations of J. M. Mackinnon, manager of the company.

Current Trade Conditions

Ontario.

Ottawa is experiencing a slight stiffening of prices, as a result of J. R. Booth publishing his prices and not following the lead of a few others who had announced small reductions. The others are now coming up to his level. Although business is still slack, the outlook is better than for some time past. The English demand is increasing, and is now fairly good. Good buying is also expected from the United States. In the Georgian Bay district, there is little activity as yet. In fact there is almost nothing to say that was not said a fortnight ago. The lakes are still frozen, but the rivers are open. Probably in a week or two, if the weather is favorable, the mills will commence sawing. The lumber manufacturers have been stirred to considerable anxiety by the new freight schedule which the G. T. R. and the C. P. R. have issued, and which increases freights on lumber to the principle Ontario points. They are taking action to have the Dominion Railway Commissioners interfere, as they consider the market in its present condition can scarcely stand the threatened strain.

Eastern Canada.

In Eastern Canada, there are few signs of life as yet in the mills. In St. John only four of the larger mills have commenced sawing. Provincial and local trade are fairly active, in some lines, but the improvement is not general yet. Long lumber for the English and American markets is quite inactive. There is practically no forward buying. The unfavorable conditions in the manufacturing business have caused a slight reduction in freight rates to English points, which may do something to improve matters. Upon the rivers a very different story is told, and it looks as though there will be a large supply of logs for the summer, whether they are wanted or not. The spring freshets have been heavy, but not sudden. On most of the large rivers and the tributaries the logs are already well under way. Quite a number of logs on the St. John have escaped, and a few will be carried out to sea, but no heavy loss will result.

Western Canada.

Encouraging reports from the West still continue to come in. The improved outlook in the prairies, resulting from good crop forecasts, is making a better demand for British Columbia lumber. There is a great deal of unrest, however, resulting from the uncertainty caused by the Dominion Government's recent regulation requiring the cut of 100,000 feet per square mile and the erection of a saw mill within six months on Dominion lands. Stocks are already heavy and prices low, so that a flood of fresh logs would probably paralyze the market. Strong representations are being made to the Government to have the regulation cancelled. Reports continue of large United States operators obtaining interests in British Columbia and preparing for extensive operations.

United States.

New York reports that current business conditions show no material change. In the wholesale trade some houses report a considerable increase in business, with prices firm in some items and others showing a tendency to readjustment. Generally speaking, the trade has adapted itself to the new conditions and is more inclined than ever to forget the past. Supplies are, in nearly every instance, sufficient for current demand, and it is expected that prices must naturally readjust themselves. Competition in yellow pine is sharp with a small amount of business offering. Spruce also shows considerable compe-

tion, although the general spruce market is in an unsettled state. In general the prevailing opinion is that for the rest of the year 1908 consumption will not be extensive. Indications, however, are that there will be sufficient trade to keep everybody going. Chicago conditions are rather sluggish. Retailers have been expecting to make extensive sales with the opening of the building season, but their hopes have not yet been realized. Mixed cars and small lots for immediate shipment have constituted the bulk of recent business. Some west coast manufacturers are making prices which mean that lumber is being sold at less than stumpage value and the cost of milling. Northern pine has stiffened up, quite a quantity having been sold at an advance. Better conditions are noted in the eastern markets, where white pine is in demand, and there is a quite a tendency towards strengthening in prices. The hemlock situation promises to continue unpleasant as long as yellow pine remains at its present price. A few yellow pine producers continue to flood the market at low prices, and others in the trade are hoping that this will soon come to an end. At Buffalo, conditions are looking much brighter and the trade in general is enjoying a general increase in business. Prices are about steady and the general belief is that business will continue to increase. The same is true of North Tonawanda, where many of the yards are loading cars, and business for the last two weeks has been much increased.

Great Britain.

London advices report that the market has in no way improved since our last issue. Demand is very light and deliveries from the docks are 2,300 standards below the figures of March, 1907, which were also very small. Prices, however, have not fallen. The stock of Baltic deals and battens is extremely low, but there are increased holdings of rough and prepared boards. The stock of the former is away above the average, and at the present rate of consumption it will last for over six months. Pine and spruce stocks continue light, but the small demand renders them quite sufficient for the present. In pitch pine, sellers appear to have modified their prices and forward selling has been renewed. Very little business is going on in hewn timber. Lumber 11 inches and up is quoted at \$80 to \$85. The stock of sawn pitch pine in the London docks on April 1st was 15,000 pieces, a little more than last year's figure. The stock of deals is quite heavy, being 61,000 pieces, as compared with 44,000 at the same time last year. The demand, however, is poor.

Liverpool business is reported to be satisfactory only. A few large inquiries are coming out, but business is light. The scarcity of St. John's spruce offerings of long average is causing a ready sale for some "Swag" white deals, and unplanned shelving boards, lately arrived. Spruce deals to the number of 23,000 pieces have arrived for one firm by the Virginian, and 100 standards of 3 inch by 11 inch have also arrived by the same steamer. Manchester reports show dullness in the small orders, and a hand-to-mouth business. No improvement in forward buying is noticed, except in Riga goods. Information regarding spruce is reported as difficult to obtain, and rarely reliable. Three large firms are reported to have fixed cargoes for May loading.

Bristol dealers expect the financial stringency to have a deterrent effect on production, in Europe, Canada and the United States. Merchants, therefore, are hesitating about making contracts, unless profits show bigger margins than in the past year or two. The outlook is said to be no better for an increased demand than it was a year ago. The building trade is not only slack but bad. Early buying will be only for positive requirements, not for speculation. Another west coast report, referring to spruce deals, says there is more confidence in the "future" market than the ordinary observer would imagine. Although no early rise is expected, values may rally considerably during the next month. Stocks are beginning to look very broken.

CAMP DEPARTMENT

Improvement in Lumber Camp Fare.

There is quite a difference between the treatment of the men in the lumber camps to-day and that which they used to receive a few years ago. Difficulties with time-keepers and others who have to attend to employment matters, in connection with the men, are unfortunately still rather frequent, as will be seen from the complaint which appeared in the last number of the "Canada Lumberman." These matters, however, are to a great extent the result of misunderstandings and of personal actions on the part of individuals. The general treatment of the camp laborer is so greatly improved that the men in the camps are themselves the first to acknowledge it. In the matter of camp supplies, those in charge of the provisioning have come to appreciate the fact that the general welfare and happiness of the men cannot receive too much attention. Happy, well-fed laborers in the camp are the best safeguards against labor difficulties. In addition to this, the contented laborer is a better worker, and does much to make other laborers seek employment in the same camp. Certain camps get a reputation for feeding their men well and it is not long before laborers commence to flock to them.

As to the general improvement in camp conditions, one need not go far to find examples of it. Pork and beans and hard tack used to be the staples. To-day, in a well managed camp, the laborer will find on the table a first rate variety of food. A good cook is one of the essentials of a camp staff. Heavy long clear used to be the only class of pork to be found in a camp. Now, the lighter grades are common, and hams and breakfast bacons are frequently seen. On the breakfast table there are often served good sausages, which are bought from large commission houses in the cities. They are sold in 50 pound tubs, sealed in lard, and only the best class of pork is used in making them. A few years ago dried apples were also a staple, and they deserved the name, for they were about the driest things in the way of apples that were ever produced. Evaporated apples have put the dried article out of business, and a tasty dish of apple-sauce, which makes one think of apples as he eats it, is a welcome article on the bill of fare. Good apple pies are another result of the change, and doubtless many a man has thought of the pies his mother used to make, as he sat down to a quarter section of the camp cook's pie. Evaporated apples are bought by the camp supply buyer in 50 pound boxes. In fact, in the matter of fruits and vegetables the camps can look back upon the old days of a few years ago, as a time when they lived in very primitive style as compared with to-day. Dried and preserved fruits and vegetables are an everyday article. Raisins and currants are to be found in puddings and pastry as often as the men wish for them. Good teas and coffees are the only kind in demand, and when a man has been all day long in the wintry woods he relishes more than anything else a steaming drink of his favorite beverage. The lot of the lumber camp laborer is in short something to be envied by many who are feeling the pinch of poverty in the cities, and by many who are in good circumstances.

The provision buyer is a man of no mean importance in the camps, as can be well understood from the foregoing. Next fall he will be in the middle of his hard work. But to-day he is looking about and considering the future season carefully. In August he will have to commence interviewing the provision merchants and seeing what is to be had. In the matter of pork, ham and bacon, it is not difficult for him to obtain good supplies, but at present he cannot foresee what the market will demand in the way of prices for them. Everything depends upon the price of the hog, which again depends upon the farmers' success in raising it, and his skill in marketing it. Groceries and provisions can be gauged, as to price, for a month or two ahead, unless some unforeseen occurrence makes a difference. To-day the indications are that groceries will be about 10 per cent. lower in price on the average than they were last year. That is the condition prevailing at present and wholesalers see no immediate probability of a change.

Commission merchants are feeling no little concern about the present condition of the lumber market, which promises to reduce lumbering operations considerably next fall unless a change for the better soon occurs. They have been told by the lumber manufacturers that unless an improvement sets in there will be a number of the mills closed down next year. This means that there will be far fewer camps in the winter, and the camp supply business will be a heavy loser as a result. Whether this is not a little too pessimistic a view of affairs to take at present, is a question. The last week or two has witnessed quite an improvement and the indications to-day are that although the coming summer will not see more than a quiet business, there will be a gradual improvement, which by the arrival of fall will warrant the manufacturers in placing a good number of men in the camps during the winter.

Commission and grocery houses report quite a good demand recently for supplies for the drivers. These are sent in before the commencement of the drive, and though they do not amount to such large orders as those of the fall, they have been fairly heavy this spring because of the fairly large cut last winter and the large number of logs which were left from last year which still have to be brought to the mills.

May End St. John River Troubles.

A Washington, D. C. despatch says: Senator Hale introduced a bill last week which is designed to terminate conflicts between Maine and New Brunswick lumbermen whose difficulties recently have been the subject of a number of diplomatic exchanges. The bill is to repeal Section 2508 of the Revised Statutes which permits the free importation of logs and lumber owned and cut by Americans in New Brunswick. The lumbermen of the two countries have engaged in fierce battles on the St. John river and the situation has become so serious that the Maine Senators and Secretary Root have given a great deal of attention to working out a programme to end the trouble. They concluded that the only way was to withdraw the privilege of free importation from foreign territory of American owned lumber.

Unemployment Among Lumberers.

Mr. H. A. Kennedy, of London, England, who visited Canada last winter, has published a very conclusive pamphlet upon the unemployed in Canada, and the causes of the trouble. Among other things, he says: It is not the manufacturing industry of the towns alone that has had to retrench. The lumbermen have felt the pinch too. Now, the cutting of timber is one of the country's most important industries, and it is particularly important from the laboring man's point of view, because it becomes busiest just when work in general becomes slackest. Thousands of men employed on farms all summer go to the woods when the agricultural season ends, and spend the winter in the lumber shanties, cutting down the trees and hauling them over the snow to the rivers, which are to float them down to the saw mills on the opening of spring. If, therefore, the owners or leasees of timber limits have to retrench, the men they would normally employ are driven to seek work in the towns; and this at a time when, even in an ordinary year, there is least work to be had.

Forty men employed on the Huntsville Lumber Company's drive at Marion Creek, quit work recently. The men have been receiving from \$30 to \$40 per month, and were asking an increase to \$45 and \$48. The wages prevailing on the drive are from \$30 to \$35 and only in some instances is the larger figure of \$40 paid. There seems little likelihood that the company will yield to the demands of the men. A new gang is being made up, and it is expected that the full complement will be made quickly. The trouble occurred at a most embarrassing time for the Huntsville Lumber Company, as upon the active prosecution of the work at this particular time, much depends in getting the drive out during high water, and in time to keep the mill operations uninterrupted.

Word has reached Lindsay, Ont., of the death by drowning of Angus St. Thomas, a river driver, in one of the chain of rivers 20 miles to the north. St. Thomas had been in the shanties, and was working his way down to Lindsay along with others of the gang. He was alone when the accident happened, and his body was found supposedly half an hour after death by his brother. The St. Thomas family are well known throughout Victoria County.

A British Columbia report says that lumber camps in the interior are beginning to open up, and this is having a good effect upon general trade. There is already a good demand for supplies. City trade continues fair, with staple lines doing a normal business. The outlook for summer business is good. Collections are generally fair to good, with some improvement noted from interior points.

Mr. B. E. Fernow, L.L.D. of the Department of Forestry, University of Toronto, editor-in-chief of the Forestry Quarterly writes to us saying that he would like very much to know how far systems of logging by steam are employed in the Canadian woods. Can any of our readers give the addresses of firms using such systems?

Pine Wood Distillation.

Dr. L. F. Hawley, of the Forest Service, Washington, recently read a paper on "Pine Wood Distillation" before the Alabama and West Florida Lumber Manufacturers' Association. Among other things he said:

"All of you are aware that a large part of every tree cut in lumbering operations never comes to the market as a saleable product. If, however, you have not seen the figures recently computed by the Forest Service you will be surprised to learn just how large this proportion of non-marketable product is. In the case of the longleaf yellow pine from 40 to 60 per cent. of the tree is not used for lumber; this unused part includes as a waste in logging, stumps, limbs, cull logs, etc., and as a waste in sawing slabs, edgings and sawdust.

"It was to find a possible use for these wastes from the yellow pine that the Forest Service turned attention to wood distillation. Two general processes of wood distillation were in use; (1) The destructive distillation process in which the wood is heated to a temperature high enough to completely char it; by this process not only turpentine but also charcoal, tar, heavy and light oils and other products of the decomposition of the wood was obtained; (2) the steam distillation process in which the wood is heated by steam only; by this process only turpentine is obtained and the wood is not decomposed. These processes have been used more generally on lightwood which contained more resinous matter than the usual saw mill waste, but lately the steam process has been applied to saw mill waste with apparent success.

"A study of the turpentine produced by these two methods has shown that by the steam process it is possible to prepare a turpentine fully equal to gum turpentine, and that the turpentine produced by the process of destructive distillation is not entirely similar in composition and properties to gum turpentine, although it can be used similarly in many cases. A great difficulty in marketing of these wood turpentines has been caused by the variation in the composition of the turpentine from different plants and even in different shipments from the same plant. The buyers and users of turpentine are still prejudiced against any wood turpentine, although some plants are turning out a very uniform and excellent product. On this account everyone producing wood turpentine must work up a market with some few consumers by gradually showing the uniformity and value of the product—a slow process which calls for an efficient and expensive sales department.

"This is a condition which it is proposed to remedy by some of the future work of the Forest Service along this line. It is planned to experimentally refine some of the crude deposits from saw mill waste and submit samples of the refined products to the paint and varnish makers for trial and judgment. From the results so obtained it will be possible to determine the grades of turpentine best to prepare for market; and when specifications are drawn up for these grades it should be necessary only to make the product from any plant correspond to these specifications in order to find a ready market at a price corresponding more closely to the actual value of the product than at present.

"We hope that the time may soon come when every saw mill of sufficient size will be equipped with a plant for obtaining the turpentine from its waste material and will be making a profit from what was before not only useless but even a source of expense and loss."

The A. J. Burton Saw Company, Limited, have been appointed exclusive British Columbia agents for James Robertson & Company, makers of babbit metals; H. Walters & Son, Hull, Quebec, manufacturers of planer knives, and the Gorham Rubber Company, of Seattle. They are carrying a large stock in their Vancouver warehouse of babbit metals and "Amazon" and "Tyee" brands of belting. Speaking of business conditions, Mr. Burton said that, with them, they had been very good. All things considered, they had no complaint to make. "Considering the number of saws we have placed," said Mr. Burton, "the lumber business does not appear to be as bad as it is reported to be. We have been able to keep our full staff employed throughout the winter and spring."

The A. R. Williams Machinery Company, of Vancouver, report, among other recent sales, one 4-sided moulder, to J. Kernahan, Salmon Arm, B.C.; a 36-inch wheel band saw machine, to the Ladysmith Lumber Company, Ladysmith, B.C., and a No. 2 chain saw mortiser, to the Bean Manufacturing Company.

As lumber grows more scarce it is worked thinner and more skill is required in order to make it serve the purpose. Therein lies consolation for the worker in wood.

"WANTED!" "SLABS AND EDGINGS"

Is there, in effect, such a sign up in your community?
That is, is there a demand for firewood?
If so, why burn it up under your boilers?
Why not sell the wood and run your plant with your SAWDUST?
The Gordon Hollow Blast Grate gives as good results with wet, green or frozen SAWDUST as a draft grate gives with DRY WOOD.

WE TAKE THE RISK

We have been making this grate for sixteen years, and know what it will do. Such is our unlimited faith in it that we are perfectly willing to ship you an outfit with the understanding that you may test it in ANY manner you may see fit for THIRTY days, and that if you decide not to keep it, we will pay the freight BOTH WAYS.

This protects YOU. It also shows OUR good faith. It is not what we SAY, but what the grate DOES for YOU, that is to decide whether or not it becomes a sale.

Saves labor in firing. Lasts forever. Only expense first cost. Equally efficient in ordinary furnaces or Dutch ovens. Adapted for any number of boilers, from one up. No change in construction necessary. A hole must be made through each wall, for the pipe; aside from this, not a brick need be disturbed. The largest outfit can be put in between quitting time Saturday and starting up time Monday morning. No difficulty about maintaining a fire at night when the blower is idle, and no objection to so doing.

State how many boilers you have, and whether you have ordinary furnaces or Dutch ovens, giving the width and length of your grate surface, and let us submit a proposal for your consideration.

EDGINGS

The Citizens' Lumber Company have commenced business in Medicine Hat and Claresholm, Alta.

The Fort Alexander Lumber and Manufacturing Company, Limited, wholesale, recently started business in Winnipeg.

The Keewatin Lumber Company started its night gang last week, and the mills will start to run on Monday. Over 100 men are now employed.

The Clowholm Falls Lumber Company, Limited, of Sechelt, B.C., have recently added two additional Simplex upright shingle machines to their plant.

Booth's mills, employing some 1,200 men, commenced work on May 1. The wages are to be the same as last year, when ten per cent. increase was obtained.

The Fairview Cedar Lumber Company are moving their plant to another site, owing to the new False Creek bridge crossing their present site. They will not be able to cut lumber for the next five or six months.

Mr. Robert Watt has applied for permission to establish a planing mill and lumber yard at the corner of Campbell and Tennyson avenues, Toronto. The City Architect and the Chief of the Fire Department urge no objection.

The Rat Portage Lumber Company, Limited, are building a warehouse in Norwood, Man., to accommodate their glazing industry. This building replaces that part of the plant that was burned on Higgins avenue, Winnipeg, some time ago.

Fire recently destroyed the barns of the Carney Lumber Company, Limited, at Owen Sound, Ont. The building and contents, including seventeen heavy draught mill horses, were burned. The loss is about \$5,000, fully covered by insurance.

The Ladysmith Lumber Company, with mills at Ladysmith, Vancouver island, propose to erect a number of houses in the neighboring town of Nanaimo, which may be secured by workmen on payment of a certain sum down and monthly instalments.

The partnership of G. R. Muir, W. H. Wilson and Jas. Park as Muir, Wilson and Company, lumber merchants, Davidson, Sask., has been dissolved, and the interests have been taken over by Mr. Muir, who will continue to do business at the old stand.

Grand Forks is looking after a pulp mill. The Kettle river runs through millions of feet of balsam of gilead and spruce and a railway has been built there. Electric power is available, a large plant having been recently installed by the West Kootenay Power Company.

The Alberta Lumber Company, of Vancouver, have just installed their new 350 horsepower engine. They have ordered a new 72 inch by 18 feet boiler from the Waterous Engine Works, and with this additional power will be in shape to turn out about 50,000 feet of lumber per day.

Operations are in progress for the installation of a large sawmill on the Capilano river, B. C., about two miles south of the dam. W. T. Farrell is at the head of affairs, and he is superintending the removing of the plant from False Creek, Vancouver, where it is at present, to the new site.

H. Codee, a milkman at the Baker Lumber Company's mill, Waldo, B.C., lost his life recently by being struck by a piece of heavy steam pipe with which he was slipping the belt on to a pulley. The pipe was caught in a revolving pulley and struck him in the breast, pinning him to the wall.

Dynamite exploding in the shanties of the Lotbiniere Lumber Company killed Gedeon Mercier last week. A quantity of dynamite had been placed on a stove to thaw out and was to be employed in breaking up ice for a drive of logs. It exploded, killing one man and slightly injuring others.

The Rat Portage Lumber Company are building a large single story warehouse by their railway siding on Tache street, Norwood, to replace the building by the C. P. R. depot, which was destroyed by fire last winter. The cost of the new building will be about \$1,000. It will be 100 feet long by 40 feet wide.

A record cut of logs for the Saskatchewan river is reported by David Garrick, a contractor for John Halters, Edmonton. The cut amounts to eight million feet and is taken from Poplar Creek, about 100 miles west of Edmonton. Garrick has a cut of one million for other parties. The record up to date was under four million feet.

It is stated that the newly organized Davidson-Fraser Lumber Company, Limited, of Moose Jaw, capitalized at \$250,000, will largely increase their holdings, especially with regard to new yards to be opened on railroad lines under construction. T. Meredith, of the Gibson Lumber Company, Revelstoke, B. C., and of Moose Jaw, is secretary-treasurer.

The Eastern British Columbia Lumber Company Limited, Fernie, B. C., which purchased the mill and timber interests of the North America Land and Lumber Company, Limited, is making extensive changes to the plant, completely overhauling the mill, and making improvements in the logging road. M. H. D. Campbell is the general manager in charge.

M. W. White and Company, of Michigan, who last year bought large areas of timber at the northern end of Vancouver island from McLean Bros., of Vancouver, paid \$1,250,000 for the property. It is now stated that they have refused \$3,000,000 for it. The mill at Beaver Cove will be erected this year and a railway will be constructed to facilitate lumbering operations.

The factory of Messrs. Robertson and Hackett, Vancouver, known as the Vancouver Sash and Door Factory, was completely destroyed by fire on the night of April 27th. The loss amounted to \$30,000, the insurance being about one-third. It is understood that a site has already been secured near the old location, and the company will commence the erection of a new plant at once.

The Dauphin, Man., Press tells of a remarkable achievement which is an incident of the lumber industry of the northern woods. Just before camp broke up two teams belonging to the Cowan Construction Company, at Mistatim, drew a record load of railway ties. The load contained 400 ties, enough to load one car and a third of another car. The team drew the load three and a half miles.

The Saskatchewan Lumber Company are erecting a large lumber shed in Guernsey, Sask. It was only on May 30, 1907, that the C. P. R. put Guernsey lots on the market and though the town has no railroad privileges in the way of local freights, etc., it has three lumber yards, one hardwood store, one general store, blacksmith, real estate office, three implement agencies and a livery stable.

The B. F. Graham Lumber Company, Victoria, are stated to be planning the erection of a new mill at Esquimalt this season. The capacity will be 100,000 feet per day and the estimated cost \$150,000. C. L. Bettington is interested.

It is of interest to note that Mr. Justice Riddell has dissolved the injunction granted some time ago to the Ottawa-Cobalt Mining and Lumbering Company against W. D. Davidson, restraining the defendant from removing timber from lands to which plaintiffs lay claim, lying between Cobalt and Haileybury. Mr. Davidson, however, is ordered to pay into court all moneys received for timber taken from the disputed lands since the issue of the injunction and to allow the plaintiffs to measure any timber cut.

A Dunchurch, Ont., despatch says: Three young men of this neighborhood, Thomas Bennett, Fred King and Jacob Knoepfli, were drowned in Ahmie Lake, off Rocky Reef, recently. They were employed by the Croft Lumber Company, whose log boom burst. The three men started with boom chains in a canoe to repair the damage. They were next seen by Mr. Stewart and family, from Rocky Reef, floundering in the water. There were no boats at hand, so the Stewarts could only watch them disappear one after another. The bodies have not yet been recovered.

The Vancouver Engineering Works, Limited, secured the order for the construction and erection of the new steel refuse burner at the Fraser River Sawmills, Limited, Millside, B. C. This burner is one of the largest burners of steel construction in the province, being 33 feet in diameter, by 100 feet high. They have also built a Scotch marine boiler for the Columbia River Lumber Company, Limited, Golden, B. C., and a 150 h.p. boiler for the North Arm Lumber Company, Eburne, B. C.

W. L. Newman, of San Francisco, is introducing a new device for felling large trees which promises to revolutionize the logging industry. Timber cutting by electricity is the method employed, and although the principles employed are not new, it is only recently that it has been perfected to a state of practicability. By the new process it is claimed that a six-foot tree can be felled in less than twenty minutes, where by the present methods employed, it takes the labor of two men an entire day.

George S. Cushing, Theo. Cushing, R. Keltie Jones and Alex. Wilson, of Moncton, N. B., and W. C. Cushing, of Pittsburg, Pa., are seeking incorporation as Cushing, Limited, with a capital of \$350,000, to carry on the general lumbering and milling business now carried on by Andre Cushing and Company at Moncton. One right asked for is to manufacture and generate electric current for heat and power, and to buy and sell electrical plant fixtures, fittings and supplies. Theo. Cushing, R. K. Jones and Alex. Cushing are the provincial directors.

The Vancouver Engineering Works have secured the order for the construction and erection of the new steel refuse burner at the Fraser River Saw Mills, Limited, Millside, B. C. This burner is one of the largest of steel construction in the province, being 33 feet in diameter by 100 feet high. The same company have also built a Scotch Marine boiler for the Columbia River Lumber Company, Limited, Golden, B. C.; and a 150 h. p. boiler for the North Arm Lumber Company, Eburne, B. C.

News from Nelson, B. C., is to the effect that the Cooke Lumber Company is arranging to open a mill on the Lardo river. This will be the first plant in that section of the province, where some of the best timber in the district is located. The Yale-Columbia Lumber Company has started its mill at Nelson and the mills at Beasley, Sloean, Procter and Creston have also opened for the season. The cut during the winter was light, but the stock will probably be sufficient to carry the mills through, while sawn lumber left over from last year, together with that being cut, will amply supply the needs of the market.

An American syndicate composed of forty-two capitalists have made an extensive purchase in the timber land regions of British Columbia. This syndicate, known as the Moresby Island Lumber Company, have closed their options on forty-nine square miles of timber limits in the centre of Graham Island, and also on forty square miles on Moresby Island. They have also purchased outright 8,000 acres of the choicest crown grant in Graham Island. The investment reaches several million dollars, the initial payment being \$250,000. A sawmill, to cost \$400,000, will be erected at once by the company and located on Cumshewa Inlet on Graham Island.

The Anglo-American Lumber Company, Limited, Vancouver, have been making some extensive changes, having overhauled and re-modeled their entire sawmill plant, re-arranging the old and adding new machinery. Part of the new equipment consists of a new slasher table and conveyor system and complete live-roll transfer system. The power plant has been increased by the addition of two new boilers, and a new 300 horse-power Corliss engine, supplied by the A. R. Williams Company, of Vancouver. This brings their capacity up to 75,000 feet per 10 hours. The Anglo-American Company report that they are finding business picking up, and are looking forward to an early resumption of prosperous conditions in the lumber trade. Geo. McAfee, formerly with the North Pacific Lumber Company, is now manager of the Anglo-American.

The Kamloops Lumber Company, which figured in the evidence taken before the Royal Commission on Insurance, is again the centre of attraction. This time the profits of the concern are cited in an action entered by Geo. W. Fowler against the Union Trusts Company, Hon. G. W. Ross, Sir John A. Boyd, Elliot G. Stevenson and John Davidson, in which he seeks to recover \$250,000 damages for malfeasance in office as directors and for fraud, conspiracy, collusion, breach of duty and negligence. This was the cause Mr. Fowler states, whereby he was deprived of monies and profits which he would otherwise have been entitled to. Fowler held 25 per cent. of the stock of the Kamloops Lumber Company, the directors being all named by the Union Trust Company. The Union Trust Company formed the Independent Lumber Company, and it is alleged the lumber was sold to this concern at \$1 less a thousand than it could be produced for. Thus, Mr. Fowler claims, the profits of the Kamloops Lumber Company were milked. Incidentally, Mr. Fowler had no stock in the Independent Lumber Company.

F. J. Fulton, Chief Commissioner, Lands and Works Dept., Victoria, B.C., is inviting tenders up to June 1st for the following timber limits: No. 1. Commencing at the southwest corner of Indian Reserve on Acteon Sound, Coast District, Range 1; thence south along the shore to the northeast corner of Timber License 13,465; thence south 40 chains to the north line of Timber License 13,464; thence east about 100 chains to the west line of Timber License 25,400; thence north about 60 chains, thence west about 80 chains to the southeast corner of Timber License 25,399; thence north to the south line of Indian Reserve; thence west to point of commencement. No. 2. Commencing at a post planted on the shore of Tsi-Bas Lagoon, Coast District, Range 1, at the northwest corner of Timber License 21,891; thence south about 20 chains to the north line of Timber License 14,465; thence east about 20 chains to the line of Timber License 14,656; thence north about 60 chains; thence west about 120 chains to the shore of Tsi-Bas Lagoon; thence southeasterly along shore to point of commencement.

Always in the Market for Mill Cuts

Always for Sale

149 Broadway, NEW YORK

Just A Word to Sawmillmen

Our business is handling lumber (Hardwood and Softwood) of all kinds, lath and shingles, in car load lots.

We personally interview manufacturers of various kinds in Western Ontario who buy only car load lots our aim being to sell them WHAT they want WHEN they want it.

The market is wide and wants various.

Will you send us a list of what you want to dispose of no matter what it is and we will place it before the manufacturers most likely to use such as it is.

Our personal connection with these consumers may serve to effect a sale which otherwise might be missed.

Business may result to your profit.

There is some one wanting or soon will be wanting just what you have to sell and may not know where to get it.

At Present We Want

1 car or more of 5/4" Winter Sawn Basswood.

6/4", 2" Black Ash.

2" Soft Maple.

1" Basswood.

"QUALITY IS THE BEST POLICY"

Getting Business

When it comes to Getting Business the world at large thinks as a unit.

We all want business, profitable business, increasing business, and a clean agreeable business. We want to conduct it in such a way that it will reflect credit on us and gain us friends and customers who will stay friends and customers because they always get a square deal.

If you are a Contractor and Builder it's to your interest to use the best of materials and do your work well—the result will be a life-long advertisement (and it pays to advertise).

If you are a Retail Lumberman the stock you carry and send out does your advertising,—if it's good it brings business,—if it's poor it brings the other fellow business. Is your advertising benefiting you or the other fellow?

"Quality Pays"

Quality stock on your yard will hold old trade and bring new. It will mean satisfaction to you and your customers. Our "Quality Policy" has proved a tremendous success. Try it.

There are more DISSTON BRAND Band and Circular Saws used than any other make, and by a large majority.

WHY?

Because millmen and sawyers recognize by the use of the DISSTON SAWS they obtain the greatest results for the least cost.

WE MAKE THIS STATEMENT WITHOUT FEAR OF SUCCESSFUL CONTRADICTION.

POINTS OF MERIT

MATERIAL

FINEST
CRUCIBLE STEEL

UNIFORMITY.
TOUGHNESS.
GREATEST TENSILE STRENGTH AND ELASTICITY.

**HARDENING
AND
TEMPERING**

DISSTON
METHOD

Being Manufacturers of our own steel, and thoroughly familiar with its makeup, we are able to absolutely adjust the hardening and tempering processes to the degree giving that perfect combination of hardness and toughness that produces the "edge, tension-holding and standing up qualities" for which the DISSTON SAWS are renowned.

GRINDING

DISSTON
METHOD

By the DISSTON METHOD all Band Saws are ground perfectly flat and uniform in thickness, thus making possible a very close adjustment of the guides without creating any friction or heat when in operation at the highest rate of feed; and all Circular Saws, whether tapered or of even thickness, are perfectly flat ground on the surface, thus insuring in all saws perfect clearance and true balance.

TENSIONING

DISSTON
METHOD

The uniformity of the material, temper and grinding is a large factor in the proper adjustment of tension; and this, together with the Disston process of tensioning, is the reason why the DISSTON SAWS will manufacture more lumber, under the same conditions, than any other brand of saw.

In the DISSTON BRAND of SAWS you have the advantages of the product of a progressive, up-to-date saw factory, the LARGEST IN THE WORLD, and where saws are made throughout, from the making of the steel itself—the superiority of which has been demonstrated for the past fifty-three years—to the finishing operation, and each process is performed by mechanics of long experience and highest order of skill.

WE HAVE BEEN MAKING SAWS FOR OVER 68 YEARS

RETRENCH!

SAVE THOSE SLABS AND BOARDS

What's the use letting your slabs, boards, and other odds and ends find their way to the refuse pile when this machine will convert them into shingles at a handsome profit? The spalting attachment on the

COLUMBIA SHINGLE MACHINE

is for just that purpose, and many's the dollar that's being made from refuse that formerly found its way to the boiler.

In any clime, in any wood, the Columbia is the shingle producing machine par excellence. Catalogue and details await your name and address.

PERKINS & CO.,
GRAND RAPIDS, MICHIGAN.

Iron Frame "Simplex" Shingle Machine

IN this, our latest design of Shingle Machine, we have incorporated all the advantages contained in our wood frame "Simplex" and added several improvements.

The arbor has been made heavier and a third bearing added to support it outside the driving pulley. The method of putting lead in the saw arbor has been greatly improved. This is now done by swinging on a centre directly under the saw the whole frame which carries the arbor. Thus the alignment of the bearings is not in any way affected and there will be no danger of hot bearings after the lead has been changed. The change may be made while the machine is running and without stopping the carriage.

An improvement has also been made in the method of driving the edger. It is belted direct from a shaft running at right angles to the main arbor from which it is driven by means of a bevel friction. This makes a very neat compact drive and has proved satisfactory in the mill.

The rail on which the carriage travels is made of square steel and when worn can be renewed by simply turning upside down.

Over three hundred of our Upright Machines (wood and iron frames) are in use in British Columbia and Washington.

Lath Mill and Picket Machinery

OF DIFFERENT SIZES AND CAPACITIES

Four Saw Bolter and Five Saw Lath Mill have cut in ten hours 84,100 Laths, four ft. long, $1\frac{1}{2}$ " wide and $\frac{3}{8}$ " thick, counted, tied and piled. The machines were capable of cutting still more, but this was all that an ordinary lath mill crew could stand for ten hours steady.

Fig. 1.

New Patent Mill Dog

We claim many points of superiority for our Patent Mill Dog, of which One Hundred and Twenty-Five have been sold.

Each mill dog contains ten dogs; six of the dogs have the down-forward motion and four of them the upward motion, so that the log or cant is dogged both on the top and bottom, preventing it from turning its position on the head-block. Even if the log were dogged, not touching the head-block, it would hold the log as well.

"THE DUNBAR"

New and Improved

STEAM LOGGING ENGINES

Best on the Market

This is the machine for which we claim all the good Qualities possessed by any other
and a great many valuable improvements besides.

At first glance it strikes one that the cost of a "Dunbar New and Improved Logging Engine" is large, but on close analysis it can be easily demonstrated that it is one of the very best investments a Lumber Operator can make. Take, for instance, first, the cost of machine, \$6,000, and suppose it costs for sleds and other equipment for a large operation \$4,000, totalling in all \$10,000. Now, as intimated, this may seem large, but let us see: 20 teams (40 horses) at \$500 per pair, equals \$10,000. Here we have the full cost of the engine and outfit at once, and, in addition, there is the cost of sleds, harness, &c., which will mean from \$1,500 to \$2,000 more.

Our reasoning is this, then: To get a fit-out of horses, sleds, &c., that will do work equal to that done by the Logging Engine, it will cost nearly \$2,000 more, while the cost of the operation comparatively is as \$45 is to \$112 per 24 hours. See the immense saving here. In one operation for one season it would amount to nearly the value of an Engine, viz., \$6,000; but this is not all. Bear in mind that when you cease to operate the engine the expense also practically ceases, but not so with the team question—horses must be cared for and men paid whether in full active work or not. The reader will quickly see the result. Supposing you have sixteen men more than you would require with Engine these would cost, including board, \$2.50 to \$3.00 per day, and the horses' feed say \$15.00 per day, all of which amounts to about \$60.00 per day, so you are here making a large saving every idle day.

In view of all the facts can you afford to be without a "Dunbar New and Improved Logging Engine?"

TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per Year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

"The Canadian Lumberman and Woodworker" is published in the interest of and reaches regularly persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canadian Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 11

A Uniform Bill of Lading.

The movement under way at present, to have the railways adopt an open and uniform bill of lading, will probably appeal to the lumber manufacturers as much as to anybody else. The statutory bill of lading at present in use is a very ancient affair, and with all the regulations which have been added to it by the railway companies it is one of the most fearfully and wonderfully constructed commercial puzzles that ever had to be solved. The railway regulations in reality have no effect in law, that is, if the shipper is aware of the fact. When trouble arises regarding a shipment and the matter goes to law, the railway company invariably pleads that the shipper agreed to the regulations, and relieved them of the particular liability at issue. The shipper, by showing that the regulations are not a part of the statutory bill of lading, may escape these liabilities. All this difficulty, however, is to a large extent useless. With an open bill of lading, unburdened by regulations, there would be little necessity for going to law and all parties concerned would in the end get off that much cheaper.

An oddity of the present situation is that the law relating to common carriers is decidedly more hard upon vessel companies than upon railway companies. The liability of the owners of a vessel for the freight they carry is greater than that of the railway companies. In several instances vessel owners have been held liable in the courts for shortages of grain, although they had employed men to verify the count and to watch the hatches of the vessel during the voyage. Railway companies carrying lumber refuse to accept any such liability, and if a shortage is found they always shift the responsibility to the shipper.

For the convenience of the trade, as well as for its welfare and that of the railway companies also, all this uncertainty ought to be done away with.

The Dangers of Price Cutting.

The situation in the lumber business throughout Canada at present is anything but satisfactory. Manufacturers have been hanging on to prices as hard as they can and are still anxious to do so, but they are finding themselves up against a serious proposition. In order to make ends meet they must have money, and about the only legal way to get money is to sell something. Many a manufacturer to-day is getting rid of whatever stock he happens to be long on, at rates below those of the list prices. Taking the whole business into consideration, this causes a reduction almost throughout the whole list.

If this state of affairs continues it will be difficult to foresee anything but trouble in the near future. The situation ought to be faced philosophically. Price cutting on a small scale, of course, can never be avoided, but in a large, continuous and competitive fashion it is sure

to be disastrous and should be discouraged under present conditions. If cutting would bring a larger demand it might be justified, but it is doubtful whether at present, if prices were cut all to pieces, any increased demand would result. People have not so much money to-day to spend on lumber as they had some time ago, and probably would not take it any more at prices lower than those that have been cut. A certain amount of lumber has to be bought even in the dullest time, and if manufacturers can keep the list prices until the financial conditions begin to improve it is not unlikely that they will find their stocks just as short as they would have been otherwise, and their purses considerably more plump. For the sake of maintaining credits, also, it is the course of wisdom to keep prices up. Banks will naturally take an owner's own selling valuation of his stock, when arriving at a basis for granting credits. The most disturbing factor in the whole lumber business to-day, as it is also in many another business, is the Presidential election in the United States. Until it is a thing of the past uncertainty will probably characterise business.

Freight Increase An Injustice.

Ontario manufacturers of lumber, particularly those who ship from Georgian Bay points, have reasonable cause for complaint against the railway companies for the new schedule of freight rates which they put into force on May 1st for the carriage of lumber. As stated in a previous issue, the new tariff involves a freight rate increase on shipments from Georgian Bay points to the principal consuming points in Ontario, while apparently for the sake of argument reductions have been made to two or three places, whither very little lumber is sent. The manufacturers have already placed their complaint before the railway companies and have pointed out that the increase will mean a heavy burden upon the industry at a time when it is already seriously depressed.

Lumber dealers are not optimistic enough to expect any decided improvement as the result of their complaints to the companies. They are going the right way about the matter, however, and do not intend to leave any stone unturned. If the railway companies show a conciliatory spirit it will be so much the better for all concerned. If the contrary, however, is the case, the lumber manufacturers will take the matter to the Railway Commissioners, before whom they will be able to present a strong case. The average annual cut of the Georgian Bay district is 600,000,000 feet. The increased rates will average about 50 cents a thousand feet. Making allowance for the lumber shipped by vessel, the increased tax upon the lumber manufacturing companies will be about \$100,000 per year. This is a nice little sum, and no doubt under present conditions the railway companies will be more than happy if they get it, for it would help to some extent in tiding over the present period of depression. Whether the railway companies, however, have a right to increase the burden upon the lumber manufacturers for the sake of escaping their own share of the general burden, is a point which will have to be decided upon. Lumber manufacturers believe that the tax is an injustice.

Whether they should bear the railways' share of the burden or not, lumber manufacturers should not be called upon to pay an increased freight rate without first being consulted upon the point. If the railway companies are at liberty to increase rates, however small the amount, there is no reason why they should not some day decide to make an extensive increase. In order that the matter may be settled satisfactorily it is necessary that the Railway Commission should be given control over the whole subject. Under such conditions the interests of the lumber manufacturers would be properly represented before any increase were made.

It is difficult to follow the reasoning in a recent article in the Edmonton Bulletin, Hon. Frank Oliver's paper, upon the matter of the new cutting regulations which have been passed by the Dominion Government. The Bulletin claims that the regulations make a distinction in favor of bona fide lumber companies as distinguished from speculators. The line of the argument is that companies owning a number of claims along an inlet must put in camps and cut the timber, or else lose the claims. Bona fide companies, it believes, will find this easy to do and speculators will not.

This seems all right from a logical point of view, but it fails when put into practice. The result of compelling companies which own a number of claims to cut a certain amount of timber from them, will be to force a great quantity of lumber upon an already dull market. Like a good many contentious questions, this one has two sides to look at, and it may be made to appear as if both sides are all right. But in the present case it cannot be shown in a manner to carry conviction to those who are acquainted with the facts, that there will be an advantage derived from the new regulations, to compensate even slightly, for the losses that will fall upon the bona fide members of the lumber trade.

A Letter Worth Reading.

The following letter regarding the recent increase in freight rates on lumber from Georgian Bay to other Ontario points gives a pretty fair idea of the point of view of the manufacturers. The letter was written by a prominent Georgian Bay dealer to a large Toronto firm and is follows:

"I have been thinking over our conversation in reference to the recent raise in freight rates by the railways; and it appears quite plain to me that the law should be that the railways should be obliged to go to the Railway Commission and get their consent before they can raise rates. If they can raise one cent per 100 pounds they can just as easily raise the rate by five cents. The public should be protected from these pirates, as the roads were built by grants from the municipalities through which they passed and then handed over to the companies, who have continued to rob the public and will no doubt continue to do so to the end of the chapter.

"In 1894 we had a rate of 10 cents to Black Rock, and until recently this rate was in existence, and if the railways could carry freight at that rate twenty-four years ago they should now carry it for a less rate, as there is so much more to carry. I hope your meeting with the Canadian Freight Association will be a great success and that when we go before the Railway Commission we will get rates put where they should be. I also think we should attempt to amend the law compelling railways to get the consent of the Commission before rates are raised."

Montreal Asks for Timber Commission.

The council of the Montreal Board of Trade has adopted a resolution in favor of the Government taking steps to preserve Canada's forest and pulpwood resources. The resolution was not passed without a lengthy debate and in its final form was somewhat of a compromise. It read as follows:

Whereas serious inroads are being made into Canada's easily accessible timber supply and such denudation would greatly impair the efficiency of water powers and would also lead to the sterility of the soil, as is conclusively proven by the experience of other countries:

Whereas, according to the Department of Agriculture at Ottawa, the quantity of pulpwood exported to the United States during the calendar year 1907 was 810,541 cords, and there is every indication of that amount being constantly increased;

Whereas, the manufacture in Canada of this wood into pulp and paper would mean a great increase of industrial wealth;

Whereas this question of forestry and forest industries is a vital one for the whole Dominion of Canada, and it is advisable that the resources in question should be guarded and protected;

Therefore, resolved, that the council of the Montreal Board of Trade hereby advocates the appointment by the Dominion Government of a commission to investigate and report on the forest area and water powers of Canada; the quality of timber of all descriptions manufactured in Canada, including that used by the pulp and paper industries; the quantity of timber used for pulpwood manufactured in Canada, also the quantity of lumber, pulpwood, pulp and paper exported from Canada, and the effect such exportation has had and is likely to have on the general prosperity of Canada, and further to suggest what steps should be taken to further protect the extensive forest areas from fire, and the unlawful cutting of small timber.

Canadians Loosing English Trade.

The London Timber Trades Journal has the following regarding Canadian trade in a recent issue:

The Quebec shippers, having finished their New Year campaign, are now returning home, and, from what we hear, they have not found that Canadian goods have at the present time an increasing market in this country. Fortunately, there were very slight wintering stocks in Canada, and a very limited new supply to meet the dull market existing here since the year began. The demand for oak logs has, in fact, been practically nil during the winter, and oak scantlings are lower in price. If any dependence could be placed on contracts being properly filled by sawn oak shippers, the days of log oak would be numbered, and the railways will buy oak logs before long in very limited quantities. Owing to extremely high prices, elm has to a very large extent gone out of consumption; also birch has been in very limited demand, and, fortunately, new supplies were very short, cheap African mahogany having filled most inquiries. Ash has gone out of use almost completely.

St. Lawrence spruce cuts have been far too high to compete with Baltic whitewood, and lower port shipments have been going begging for liner parcels or inferior specifications. White pine shippers have been holding for very high prices, and those who have sold will probably have reason to congratulate themselves. Ottawa manufacturers now show a desire to cut pine deals for the English market, and already more than one mill that has cut boards exclusively for the

American market for years has arranged to cut a portion in 3 inch deals. Before holders can hope to get anything like the footing they once had in this country they will have to come down in price to compete with substitutes, that have now taken the place of pine deals. Ottawa manufacturers very unwisely cast aside during a period of inflation the regular demand for these goods on this side to gain a temporary increase in price on boards for the United States, showing very little consideration for their own interest in closing another outlet for their manufacture or for the interests of Quebec shippers who more often than not handled the Ottawa cuts at considerable loss. Sidings are unsaleable in better qualities at any profit, and even shipping culls are difficult of sale at any advance on last year.

Underhand Timber Speculation.

The Colonization Department of the Quebec Government recently cancelled the sale of fifty lots taken up in Boyer township. Boyer township is about 100 miles north of Montreal, in the Nominique district. The cancellation is the result of the lots being taken up ostensibly by bona-fide settlers, but in reality by timber speculators. The alleged habit of these people is to make a pretence at settlement, so as to meet the requirements of the law. At the end of two years they obtain a patent on the property and then promptly divest it of its timber, and subsequently move away to limits new.

Timber speculation has many forms and it can be said for most of them that they are legal and fair, but it is stretching the point too much to defend this sort of proceeding. Those who pay fair prices in competition for their limits do something more than purchase the right to cut timber. They pay, in addition, for the right to be protected from the competition of men who have obtained their limits at small expense, by underhand methods. The action of the Quebec Government in this instance should meet with the approval of all bona-fide lumber manufacturers.

This system of timber speculation, under the guise of settlement, is, unfortunately not only a very common, but also a very profitable line of business. Prices for wood, and especially pulpwood, are so high at present that the speculator gets the very best of returns for his investment of capital and labor; and so a number of people are strongly tempted to engage in these land frauds. Cutting as these speculators always cut—that is, taking every vestige of wood off the land—it is a very poor lot that won't average at least ten cords to the acre, while in the generality of cases the average is probably more like fifteen cords. Taking fifteen cords to the acre, the whole lot of one hundred acres would yield 1,500 cords of wood. And in days when farmers get so much as \$8 a cord for their wood, delivered at the railway—and even higher prices have been quoted in recent months—it is clear that there is a rich profit to be made.

Taken along with the free export of pulpwood to the United States, this underhand timber speculation, if permitted to continue, might work great harm to the timber supply. It is a matter for congratulation that the Quebec Government has taken this step. Its eyes have probably been opened to the importance of enforcing the law rigidly for the sake of protecting the timber supply. A logical step now, would be to join in the movement for the imposition of an export duty on pulpwood, the most serious opposition to which comes from Quebec farmers.

The manner in which the reduced lumber output effects manufacturing towns far from the lumbering locality is concisely told in the Galt Reporter, which says:

The reduction of the output of British Columbia sawmills, the partial dismantling of some of them, reacts on such manufacturing towns as Galt. Are not saws for these mills produced in Galt? Do not our machine shops cater largely for the trade of British Columbia planing mills? If orders go to the United States and big companies on the Coast tie up with United States exporters it means cutting into the trade of Ontario workshops. It all comes down to this—the tariff is a national, not a local issue, and as such it must be treated by the political party that aims to deal out equal justice to all the provinces. It is not fair, for instance, to take care of the steel and iron industries of Nova Scotia and strangle the woolen industries of Ontario. This the Laurier Government has done and is doing. British Columbians know what they want but they have no voice at Ottawa and can be excused for loudly complaining. Wise timber regulations and a tariff to keep their mills humming would help Galt and other towns manufacturing machinery they require. Their present plight shows how wide-reaching a real protective tariff must be to be effective.

Forestry experts are predicting a timber famine in twenty years, yet manufacturers in some parts of the country are tumbling over one another to sell lumber at any price.

Market Correspondence

Floods Cause Trouble At Ottawa.

Ottawa, May 23.—Shipping with the lumber companies around Ottawa is not so active as at this time last year. A quieter outside market is partially responsible for a smaller movement of lumber, but inconvenience caused by high water is a still greater hindrance to shipping. Booth's lower yards in Ottawa were flooded for some days, and while the firm managed to keep the mill going by the use of dams and stop logs the loading of barges with deal for the old country was hampered. The chief drawback with other manufacturers was met in towing barges up streams like the Rideau in the abnormally high water. The Ottawa Transportation Company had two barges laden with lumber of the W. C. Edwards Company for Oswego, held for two weeks at Black Rapids, eight miles from Ottawa, owing to the stiff current resulting from high water. The water is now going down rapidly on the Rideau and the chance for getting shipping back to normal conditions is very bright.

Nearly all the lumber yards were flooded and besides the loss caused by having logs swept away, operations had to cease temporarily in some of the mills.

When the Ottawa river was at its highest on May 18 the water power at the Chaudiere was reduced as much as during the most extreme dry period. The E. B. Eddy Company was compelled to close its log mill, throwing 70 or 80 men out of work. According to reports, the waters of the south tributaries have now been emptied and the north shore branches are just beginning to open. If the floods from the north and the south sides of the Ottawa had come together this season when the snow had been a record depth, the manufacturers depending on Chaudiere power believe their source of energy would have been completely wiped out.

The immense volume of water going to waste in the Ottawa, which will be much needed late in the summer to keep up water power, is making the Ottawa valley lumbermen urge the Government for the early construction of retaining dams in the Upper Ottawa to regulate the flow. These works would not only insure a steady supply of water during the low period, but would hold back the rush from almost obliterating the falls wherever it recurs. J. R. Booth and the E. B. Eddy Company would benefit greatly by a dam which they have planned to construct at the Chaudiere, in conjunction with other private owners, but will postpone the work until they learn what sort of improvements the Federal Government will provide in the Upper Ottawa.

Mr. J. R. Booth, who has been mentioned in connection with the inquiry going on at Washington to ascertain if a paper trust exists among the manufacturers in the United States, makes the statement that he conducts his paper and lumber industries independent of any outside men, and that there is no arrangement between him and any of the American paper manufacturers as to prices. Mr. Booth ships a large quantity of news print to publishers across the border, but he says he pays the \$6 a ton duty, the freight and other charges without the assistance of a combine to help him. Mr. Booth was asked to supply a schedule of his wages to combat the statement of American manufacturers that wages were lower in Canada. He sent the information and afterwards the deduction was drawn that wages were higher in Canada. This was evidently learned through a comparison of Mr. Booth's rates with the others.

Keen demand rules for first-class shingles, while the lath market is quiet. Middlemen show a tendency to sell pine shorts and dressing sidings at the lowest quotations, though there has not occurred what might be called a break in prices.

The output of the mills so far is a little less than for the corresponding period last year, but manufacturers assert that it would be a mistake to infer that the season's cut was not likely to come up to the average.

Eastern Business Is Dull.

St. John, N. B., May 25.—The continual lack of activity in manufacturing is the most prominent feature of the situation in lumbering circles. The only mills now running are Randolph & Baker's, Stetson Cutler & Company's and Murray & Gregory's. None of the other plants have as yet sawn a boat of lumber of any description. There seems to be on the part of the manufacturers a feeling of entire indifference as to whether they saw anything or not this season and several claim that they will boom their logs and hold them until more favorable market conditions materialize. None of last winter's cut of logs (with the exception of a few small lots of bank logs) have yet reached the city, but it is probable that their advent will not make any difference so far as volume of manufacture is concerned.

The manufacture of shingles is a dead letter so far as St. John mills are concerned. No agreement in regard to the wages difficulty has been arrived at by the employers and the men, and the result is a deadlock. There is not a shingle machine running in St. John. The result is that there is a famine of "2nd clears"—local manufacturers are daily refusing to quote on this line. The stock of shingles at St. John is very light; there would be about 800,000 "extras" and 400,000 "clears," which is practically a clean-up. Ex. No. 1's are more plentiful, the total holdings of this brand would be between four and one-half and five millions. Shipments of shingles from other parts of the province have been lighter throughout the month than is usual at this time of year, owing to the lateness of the beginning of the manufacturing season. Carloads are being marketed at prices which leave at the mill \$3.30 for dutiable "extras" and \$2.85 for dutiable "clears."

Owing to the shingle famine at St. John, North Shore manufacturers are shipping quantities of 2nd clears to dealers in this city and vicinity.

The log driving season has been so far a very favorable one, and it is generally thought that the river will be driven clear. The drives on the Tobique are practically all in safe water and on the Allegash, Green river, the Aroostook and the St. Francis, the work is being rushed with every prospect of success. One of the characteristics of the trade at present is the attitude of the large buyers and dealers; both local firms and representatives of English houses, in regard to "English" spruce deals. They seem to be entirely indifferent. Buyers refuse to load up at any price, and the consequence is that there are few transactions made which involve delivery at a later date. The result is a period of depression in lumber trade circles, such as has not been equalled for many years. This lack of business has also a directly derogatory effect upon manufacturing, and this effect is at once apparent in the small number of mills now running. A specification of "English" spruce deals would bring no more than \$12.50 to \$12.75 per thousand superficial feet, f.o.b. St. John, in a specification containing say 50 per cent. 7's and 8s, 35 per cent. 9's and 15 per cent. 11's and up, two-thirds price for 4ths and ends.

Trade Enquiries.

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of "The Canada Lumberman and Woodworker" may obtain the names of enquirers by writing us. State number of enquiry.

615. Furniture.—A South African firm of manufacturers' agents desire to be placed in communication with Canadian manufacturers of furniture, especially the cheap fancy class, such as tables, writing desks, whatnots, chairs, etc. Prices to be quoted f.o.b. at Canadian ports and also c.i.f. Durban, Natal, for direct shipment per steamer.

616. Veneer seats and backs.—A South African firm of general merchants desire to be placed in communication with Canadian manufacturers of perforated veneer seats and backs for chairs.

620. Timber Specialities.—An English firm of timber importers wish to get into communication with Canadian firms exporting any specialities in the timber line with a view to possibly taking up their agency.

644. Woodenware.—A London firm importing turnery and domestic woodenware of all kinds would be pleased to hear from Canadian manufacturers seeking export trade in such goods as fork, rake, pick and sledge hammer handles; fork, spade and shovel trees; skewers; dowels, wheelbarrows; also roll-top desks and office furniture.

648. Washboards.—A Scottish company would be pleased to receive quotations from Canadian manufacturers of washboards who seek export trade.

659. Hickory Pick Handles.—A Manchester firm asks for prices of hickory pick handles all sizes from Canadian manufacturers.

664. Laths.—A Lancashire firm want to obtain prices of sawn plaster laths in 500 feet bundles, sizes 3 feet 4 inches, 4 feet and 4 feet 6 inches by 1½ inches by 3-16 inch, from Canadian manufacturers.

665. Boards.—A Manchester firm asks for samples and prices of wood pulp boards from Canadian manufacturers.

667. Pine Sidings.—A Lancashire firm now buying in United States wishes to obtain c.i.f. prices of pine sidings, sizes 1 inch, 1¼ inches, 1½ inches and 2 inches unassorted best seconds and thirds from Canadian manufacturers.

669. Skewers.—A Salford firm now buying in the United States asks for c.i.f. prices of sample skewers packed in barrels, sizes 4½ inches by 5-32 inch, 5½ inches by 7-32 inch and 6 inches by ¼ inch, from Canadian manufacturers.

670. Squares.—A Manchester firm wishes to obtain prices of maple and birch squares from Canadian manufacturers.

692. Lumber, etc.—A firm in Copenhagen, Denmark, would be pleased to hear from Canadian shippers of lumber and sawn goods seeking export trade. They also mention an opening for wooden handles and general turnery.

The Canadian Manufacturers' Association have received the following trade enquiries:

1. A. Martin, Grand Via 52, Bilbao, Spain, is anxious to get quotations on timber of all kinds, and barrel staves, for delivery in Bilbao.

2. Piano Keyboards.—Messrs. DeWitt & Company, 168 Drummond street, Euston Square, London N.W., England, are buyers of best quality white basswood piano keyboards, and would be pleased to hear from Canadian manufacturers who are in a position to supply these goods. The dimensions required are: 4 feet x 15 inches, 16 inches, 17 inches and 18 inches, and not less than 5,000 boards would be ordered at one time. The firm would be glad to make contracts for regular supplies, if satisfactory arrangements can be made.

The British Columbia Tie & Timber Company, of Seal Harbor, have obtained a contract for the lumber required in the erection of a large new warehouse at Prince Rupert for Foley, Welsh & Stewart, of Winnipeg.

The British Columbia Trade

Manufacturers In a Strange Position.

Vancouver, May 25.—The big piles of lumber in the mill yards are not rapidly disappearing. There is only one mill running full time in and about Vancouver, and this mill is manufacturing for export. There were cut in April, 28,244,682 feet of logs, and at the present rate, May will be ahead of April.

The enormous booms in the water, when tight money struck the industry, are, however, being diminished rather than increased, judging from the number of swifters being shifted from the camp to the mill sides, by the busy tugs. It is also a fact that the Government sealing department have more orders ahead for sealing than they can attend to for some time.

It is true there are not so many camps going as formerly, and that logs are selling at from \$7 to \$8.50 instead of from \$10 to \$12 as they were during the busy season. It is also a fact that the situation has been very materially relieved, by the wise provision of the government permitting all cedar logs except No. 1, to be exported to the United States.

Owing to this provision a great many British Columbia logs have been purchased thus far by the Puget Sound shingle mills, at from \$8 to \$10 when they could not be sold at any price on this side of the line. It is also true that, in spite of this fact, shingles are selling very much cheaper on the Sound than here. These are the conditions as nearly as can be ascertained. The cause and affect of these conditions, however, it is harder to puzzle out. As the result of logs dropping rapidly in price, the mills are left in the position, of being able to manufacture lumber much cheaper than they could sell it for, but not being able to reduce the sale price without loss because they have a full stock on hand manufactured under different conditions, when logs were selling at \$10 and \$12 instead of an average of \$8 as at present.

Even at the present reduced list price, lumber manufactured under last season's conditions is being sold at a loss, having been reduced from \$17 to \$14. It has been frequently asserted of late that there was no money in \$8 logs, and that the fact that the price had been so reduced would stop logging for the time being. The contrary has been the case. Numerous camps have found \$8 logs pay and for this reason: In prosperous times when logs were selling at \$10, wages were higher and lumberjacks were reckless of their employers interests. They would only work periodically, and half heartedly. In this era of tight money they realize that it is a case of the survival of the fittest and for less money, at 25 per cent. salary reduction, they work harder. One experienced logging foreman claims that they get 45 per cent. more work out of the men now than formerly.

Because of the impossibility of reducing the price of lumber some very large orders have gone elsewhere. This is particularly so in the case of ties. An order for 64,000,000 feet of ties was offered here for \$11, for early delivery and could not be handled as the logs had been bought at too high a figure. The order was for Mexico and eventually was placed in Siberia.

The present condition of the log and lumber market shows how impossible it is to foretell the future. Not a mill in British Columbia figured out that the demand for lumber would suddenly cease and leave the mills with expensive logs and expensive lumber on their hands. The fact that the unexpected happens so frequently in trade, makes an otherwise rather gloomy outlook, hopeful. It is possible with big crops in the prairies, that there will be an unprecedented demand for lumber. Farmers will have money and will want the lumber at once. Dealers will not enquire why lumber is apparently so dear, and logs so cheap. They will enquire rather—"When can you rush my order through?" It must not be forgotten, however, that in any event, we will have that ubiquitous evil again with us in the rush season—"the car shortage"—and all future business should be figured out with this in view. The bigger the crop, the scarcer the cars. The cars are needed to move the crop, and we can only get what cars can be spared when sent empty to the coast. This evil will only be remedied when British Columbia can give them C. P. R. freight this way.

It is hoped that the day is not far distant when there will be large flour mills established in Vancouver for the transpacific trade. A very large business is done in the Orient in flour shipped via Puget Sound. If train loads of wheat could be sent out here from the prairies for grinding into flour for the transpacific markets, there would be then ample cars for our lumber during the busy season, and we could supply the prairie market when it most needs our lumber, without the necessity of having empty cars sent here.

Shingles are being held firm at list price in British Columbia. The fact that they are selling below cost on the Sound, does not induce

shingle mills here to throw out ballast, in the shape of good expensive stock, to prevent a downward movement of the market from over supply. The main reason for the conservative firm stand of the shingle mills here is that they have better control over the supply and can prevent a market glut by united action. Owing to the enormous capacity of the shingle mills in this province, in comparison to the market, the supply which is carefully regulated, can be increased with great rapidity, so that while the supply is kept down, there is always sufficient to satisfy the demand.

Financial Improvement.

Exchanges in the States and Canada are commencing to print articles expressing the conviction that the financial market is coming back to its natural condition. These writers, however, all state that the market cannot recover from the great shock it has received in a brief time. It will take longer than a month, and it may be six months before the people of America realize that the banks have regained confidence, and commence to "loosen up." The depression was occasioned by a lack of confidence, and it takes time to restore confidence. The panic started in New York and it is claimed that it is in New York that the better feeling has been first noted.

In British Columbia the result of the depression was not felt as much as in the east. In all lines catering to the lumbering trade the slackness of business is most noticeable. Jobbing houses and retail stores find regular business in staple lines quite as good as last year, but there is a tendency to defer purchasing, by consumers, of goods that can be done without, such as luxuries in furniture and wearing apparel, etc. In fact in British Columbia economy may still be said to be the rule of the day.

The New Barnet-McDonald Company's Mill.

The shingle mill of the new Barnet-McDonald Lumber Company Limited, at New Westminster is almost completed at the time of writing, and is expected to commence cutting operations by the first of June. This plant will be one of the largest shingle mills on the coast. The company have secured a water-front site, 1,200 feet square, on Lulu island, just across from the city of New Westminster, the property extending from the water's edge back to the main road, which runs the entire length of the island.

The shingle mill building is 42 by 80 feet, the main floor being equipped with six "Johnson-Schaake" iron frame shingle machines of the latest design, power and knee bolters, drag saws and live roll system. The mill pond has been formed by piles driven in the river. Extending from the mill to the dry kiln is a "Matthews" gravity conveyor, which automatically carries the bundles of shingles from the packers to the kiln. The dry kiln is double, being 40 feet wide by 120 feet long, and back of this again is a 60 by 80 feet storage shed.

Adjoining the shingle mill is the engine room, containing the Frost Manufacturing Company's Twin engines, 14 by 18 inch cylinder developing 300 horse power; also a 12 horse power engine, direct connected to a dynamo manufacturing electricity for lighting purposes. This electrical apparatus was supplied and installed by the Hinton Electrical Company, of Vancouver.

The boiler room, which is an iron covered building, is located 62 feet away from the mill, and contains two boilers, each 72 inch by 18 feet, running under 146 pounds pressure. One of these was supplied by the Goldie, McCulloch Company, of Galt, Ont., and the other by the Vulcan Boiler Works of New Westminster.

For fire protection purposes, the company have laid 5,000 feet of 4-inch wood pipe connected direct with the New Westminster city waterworks system, giving a pressure of 120 pounds to the square inch. This pipe was supplied by the Dominion Wood Stave & Pipe Company of New Westminster. The company have also built suitable offices and other out-buildings necessary.

The officers of the company are H. C. Barnet, Hugh McDonald, and F. L. Johnson. Mr. Barnet is a well known lumberman, and Mr. McDonald is also well known in lumber circles, having been for seventeen years superintendent of the Burnett Sawmill Company Limited, and for the past ten years as president of that company. Mr. Johnson is best known as the perfecter of the shingle machine which bears his name.

While the company are commencing with only a shingle mill at present, it is their intention, ultimately, to add a lumber mill and other industries to their plant. The limits of the company are located on Cambie Island, Howe Sound, Broughton Island and also up the Fraser river.

Agreed on Prices.

There has been considerable comment of late on the price cutting of certain mills in the interior. It is no doubt very desirable in the case of some mills which are hard up for cash, to unload at cost a lot of lumber lying idle in the yards. The trouble is, that this price cutting has a bad effect on the market at large, and a market once demoralized is hard to cure.

The result of demoralization is a wide spread and deplorable sacrifice to the lumber industry. The Coast mill men who constantly meet and discuss matters realise that for the welfare of the industry the list price must be maintained. No coercion, no bonds, or forfeits, are used.

No punishment is meted out, to the members of the association, who depart from this understanding. Each member, realises, however, that if he should cut prices, others would follow suit, and the result would be deplorable. But some of the mountain mills, far removed from the influences on the coast, have, it is said, taken advantage of the loyalty of the Coast mills, and sold at prices under those prevailing on the Coast.

As a result, a conference was held in Nelson last month between the Mountain and Coast millmen, and report has it, that the Vancouver delegates have brought back the assurance, that there will be no more price cutting by the mountain mills, and, that the scale agreed upon months ago by the mountain, and the interior mills will be adhered to. A certain mountain manufacturer, who is advertising to sell direct to consumers, will be interviewed by the Mountain Convention.

A Poacher.

A manufacturer of lumber in the interior, advertises that he will sell direct to the customer except where there are situated "independent yards." Of course this high sounding exception is beating the devil around the bush. Not to mince matters this advertiser is the first poacher on retail preserves who has deliberately announced his intentions in British Columbia.

By resorting to questionable methods in business a merchant can always gain a temporary advantage over a rival. This advantage does not last as a rule, because besides being outlawed from respectable business circles he excites business competition, and eventually brings upon himself an early collapse. This is all the more readily brought about because a merchant who will not observe business ethics and business principles, is usually a man who has no financial standing, and who is more or less reckless of consequences, having no trade or financial reputation to lose.

It is so with the lumber poacher, recklessly running into debt, refusing to pay and having his name recorded on the dead beat list he becomes indifferent to the opinion of others. His word is of no account. His bond is of little account if he can evade the issue. He resorts to unbusinesslike and unfair means to filch trade from others. There is a way of dealing with such men, and in a particular instance it can be done by his creditors compelling him to be honest, and forcing him to pay his debts. If he paid his debts he would probably not have the ability to sell lumber in another dealer's territory.

Mill Wages in the United States.

The question has often been asked, why British Columbia with her Japanese, Chinese and Hindu lumber helpers cannot manufacture lumber cheaper than it can be made in Puget Sound. The answer has been that white labor which is more profitable than yellow labor, all things being equal, can be secured much cheaper on the Sound. A trade journal has secured from a large number of mills the going rate of wages for mill hands and it would appear from this schedule that prices are about the same, the schedule depending much on the size of the mill and the nature of the work.

On the Sound, mill foremen get from \$4 to \$6; sawyers, band \$2.75 to \$6, circular \$3 to \$6.50; filer \$3 to \$9; boom man \$1 to \$3; log scaler \$1.75 to \$5; edgermen \$2 to \$3.75; liner men \$1.50 to \$2.25; cut off saws \$1.75 to \$2.75; engineers \$2 to \$4.25; (it is doubtful whether there are any \$2 engineers in British Columbia); oilers \$1.50 to \$2.50; machinists \$3 to \$4 (rather higher than in this province); millwrights \$2.50 to \$4; blacksmiths \$2.25 to \$3.50; wharf laborers \$2; wharf foremen \$90 a month; lumber yard foreman \$2.50 to \$4.50; wagon loaders \$1.75 to \$2.25; teamsters \$2.25; common laborers \$1.75 to \$2; lumber pilers \$1.75 to \$2.25 (British Columbia Oriental labor is somewhat cheaper than this, but not a great deal); chute tenders for \$2 to \$3; planing mill feeders \$1.75 to \$2.25; resaw feeder \$2 to \$4; logging camps, cooks \$40 to \$100 a month; foremen \$2.50 to \$5; fallers \$2 to \$3.50; buckers \$2 to \$3; rigging rustlers \$2.50 to \$4; chasers \$2.25 to \$3.50; donkey drivers \$2.50 to \$3.25.

Dr. Robert Bell estimates Canada's forest area at 2,600,000 square miles, or 1,657,600,000 acres, of which over half may be pulpwood.

Union Lumber Company's Operations.

Ten million dollars is the capital of the Union Lumber Company, formed at Winnipeg, which has taken over the Elk Lumber Company of Fernie, the Red Deer Lumber Company of Manitoba, the Bowman Lumber Company of West Kootenai, the Sunset Lumber Company and the Revelstoke Company properties in Canada. The Elk Lumber Company, at Fernie, B. C., north of Spokane, was the last to join the merger. It was organized in July, 1904, with a capital of \$150,000, which has since been raised to \$250,000. In 1905 the company built a large saw mill, with a daily capacity of 75,000 feet. This mill was destroyed by fire the following spring. Another much larger mill, with a capacity of 125,000 feet per day, was built and started the following season. The mill has the distinguishing feature of having concrete walls for the lower storey, the shaftings and all heavy machinery are supported on an entirely wood framework independent of the concrete block walls. The mill has a double cut band saw on one side and a circular saw on the other, with a gang saw and edger auxiliaries. Fifteen million feet of lumber is now piled up in the yards of the company at West Fernie, held over from last year's operations. A crew of men is at work at camp No. 4, above Hosmer, preparing logs for the spring run. The timber holdings consist of about 12,000 acres of lands stretching along the west branch of the Elk river from the mill site in West Fernie to a point sixteen miles above the mill. A conservative estimate places the quantity of standing timber on these limits at 500,000,000 feet, consisting of tamarack, cedar, spruce and fir.

Bulman-Allison's Salt Spring Plant.

A new lumber mill is in course of construction by the Bulman-Allison Lumber Company, Limited, on Salt Spring Island, B.C. The building is well under way and the company will install machinery of the latest pattern.

The location of the new mill is at Cushion Cove, about two miles from Beaver Point. The company have already built a permanent wharf at the cove and completed the foundations of the mills. They are now awaiting the arrival of the machinery to put the mill into working shape. It is reported that the mill will commence manufacturing in July, and will cater to both the local and export trade.

The company have acquired considerable timber on the island, and most of it in the neighborhood of Cushion Cove, where they have been engaged in logging during the past year. There is at the present time a large quantity of logs ready for manufacturing which will go through the mill as soon as it is in operation at the rate of 20,000 feet per day, which is the capacity provided for by the builders. Their holdings on the island comprise some 2,000 acres, a quantity of which has already been cut. Everything is being done on the most up-to-date and substantial plan, and no expense is being spared to make the mill a lasting feature of the Island trade. The expense entailed in the new undertaking is said to be in the neighborhood of \$30,000. Bunk houses of the solid type are erected and the site already has the appearance of a small village.

The Fraser River Company's Plans.

Manager Rogers of the Fraser River Sawmills, is reported as saying that his company will be ready to cut timber by early fall, and that the mill will be by far the largest on the entire Pacific coast, if not in the world. It will have a capacity of between 100,000,000 and 120,000,000 feet of lumber annually. The company will employ at least 300 men, of whom half at least will be white men. The pay roll at a conservative estimate is placed at twelve thousand dollars per month.

Not only are the owners of the mill building up a lumbering business, but they are building a town around their plant. The company own over 480 acres of land around the mill, and have nearly completed a number of buildings, including a large store block, office building and seventeen dwelling houses for the employees. A residence has also been erected for the manager.

A Vancouver report says that the Moresby Island Lumber Company, an American corporation which owns timber limits on Graham and Moresby Islands in the Queen Charlottes, is erecting a saw mill at the south end of Graham Island. The site is at Queen Charlotte, the new townsite at the north of Honna river, on the southern end of Graham Island.

The saw mill will have a capacity of 100,000 feet every ten hours, and will be in operation early next fall. The equipment will include a rotary saw and a re-saw, the contracts for the supply of which have been awarded. Later on the capacity will be increased, and it is intended also to erect a box factory. The company's box factory limits are located on Graham and Moresby Islands. They will cut for the domestic trade, principally for Prince Rupert. The initial investment will be about \$75,000.

HOW GRINDING WHEELS ARE MADE

The Norton Company's Alundum Products

Norton Works The Factory Behind the Wheel.

Before the invention of the electric furnace, artificial abrasives suitable for grinding wheels were unknown. Wheel manufacturers depended upon natural products—chiefly corundum and emery.

The Norton Company, in the constant aim to develop more efficient grinding wheels and materials, have during the past few years been operating an electric furnace plant at Niagara Falls, in which they have developed an abrasive known as alundum, possessing sharpness, uniformity and right temper, not to be found in any other abrasive. The introduction of alundum has been successful and rapid.

The process of making alundum consists in taking the purest amorphous oxide of aluminum found in nature, and known as the mineral blauxite, and purifying and melting it in immense electric furnaces of special design, the power for which is furnished from Niagara Falls. Upon cooling, the molten mass solidifies in ingots of alundum.

Interior Views of Alundum Plant at Niagara Falls.

Beauxite was originally found at Beaux, France, from which it derives its name, but purer forms are now obtainable on this continent. The best quality only is used in the manufacture of alundum, and in its preparation practically all impurities are removed. The high grades of Beauxite used are of rare occurrence. The Norton Company, however, owns its own mines, from which the purest grade is obtained.

Beauxite is heated in calciners to drive off the water, and is then melted. It was not practical to fuse Beauxite commercially until the invention of this process. The temperature in these furnaces probably ranges from 5,000 to 6,000 degrees Fahrenheit.

Exact quality and uniformity, which are so important in steel manufacture, are fully as important in the manufacture of alundum. In the alundum furnace both purity and uniformity are assured. Each step in the process is under the close supervision of expert chemists, who are constantly directing and following the work by careful analyses in the Norton Company's chemical laboratory.

After the ingots of alundum have cooled they are broken up and the pieces are further reduced in size by powerful crushers. Then the material is still further reduced by being passed through smaller crushers. After passing through rolls, it is subjected to washing and drying processes to prepare it for manufacture into grinding wheels, rubbing and sharpening stones, and other articles.

Solid alundum, while resembling the purest natural corundum in

chemical composition, is considerably harder than the natural product. This is due to the perfectly fluid condition to which the mass is brought, the control of its composition, the rate and method of its cooling and solidifying by which it receives its temper, and the absence of water of combination (which almost invariably exists in natural corundum).

Testing Room.—Every Norton Wheel is Tested.

In order to insure rapid and continued cutting so far as sharpness is concerned, there must be a fracture which will give a number of sharp cutting points. This is obtained in alundum to better advantage than in any other abrasive material. The recognized standard of hardness is the diamond, which is the No. 10 in the scale of hardness. Pure crystalline corundum, represented by the best sapphire or ruby, has always been the standard for No. 9 in the scale of hardness. This is readily scratched by alundum. In fact, alundum powder is used for cutting and drilling rubies and sapphires for watch jewels, etc.

"Temper" refers to strength of grain and the character of fracture under grinding pressure. An alundum grain is remarkably tough and will stand more crushing pressure before breaking than any other abrasive grain. When it does break it shows a sharp, crisp fracture, giving a fresh, keen-cutting edge.

Purity is necessary in the bonding of the grain into wheels in order to secure accurate and uniform results. Uniformity is one of the most important requisites in an abrasive. The ability to duplicate grinding wheels is essential to obtain the best results. In grinding

An Alundum Grinding Wheel.

wheels the abrasive grain of a given size is bonded together to produce a certain grade or temper for a certain kind of work. The term grade, as applied to wheels to designate the degree of hardness, is the resistance of the particles to the pressure employed in the act of grinding. A wheel from which the particles are easily broken is called soft, while one which retains its particle longer is called hard. Different grades of wheels are obtained, according to the amount of bond employed, the wheel becoming harder as the amount of bond increases.

Grades cannot be duplicated accurately without having a known and dependable factor in the uniformity of the material composing the wheel. This requisite is found in alundum to the highest degree.

The last step in the process of manufacturing the Norton wheel is testing for safety, as shown in cut.

A record of each wheel is entered on a prepared form with the description on the wheel, the number of revolutions, order number, and

for whom the wheel is intended. This record is signed and sworn to by the tester of the wheels each day before a Justice of the Peace, and carefully filed by the Norton Company. A record is preserved of each order, so that it can be duplicated exactly as to composition, cutting quality, shape and size.

Very few people realize the many uses for which grinding wheels are employed. They are used in the machine shop for sharpening all kinds of tools, cutters, reamers, taps, dies, etc., in the foundry for grinding castings. The sawyer gums and files his saws with an alundum wheel with no danger of drawing the temper of the tool. The leather manufacturer finishes the leather for suede gloves on a grinding wheel. The manufacturing optician grinds the edges of lenses for eye glasses. In glass works, beading, fluting, edge grinding of tumblers, checkering fine stars, and fine work of every character calls for grinding wheels and abrasive stones.

The Canadian Fairbanks Company, Limited, are the selling agents for Norton grinding wheels, and stones, and carry large stocks in their warehouses at Montreal, Toronto, St. John, Winnipeg, Calgary and Vancouver. Catalogues and booklets describing the manufacturing of alundum into grinding wheels will be mailed to any address on application.

The Washington Conference.

The conference of United States governors opened on May 13 at Washington to consider the conservation of the resources of the country. The American Forestry Association was represented by President James Wilson, secretary of agriculture. President D. S. Cowles of New York city represented the American Pulp and Paper Association. President Roosevelt delivered an address upon the general question of conservation of natural resources.

Of chief interest among lumbermen was the paper by Robert A. Long, of Kansas City, Mo., of the Long-Bell Lumber Company, who said among other things that from an investigation he had made in 1903, he concluded that the timber in the lake states would not exceed 60,000,000,000 feet; that within ten years it would probably play no larger part in the lumber supply of the country than did poplar at that time. He saw no reason to change that statement unless the effects following the recent panic, which are very depressing on the lumber industry, should continue longer than was now expected.

As to the life of the southern yellow pine, he believed that eighteen years would find it cutting no great figure in the lumber supply. He was more convinced of the correctness of this statement now than then. Adding the white pine, yellow pine and Pacific coast products together, his estimate was that the life for all was forty-one years. He was not so sure as to the amount of timber on the Pacific coast, but did not believe the total life of all would vary to exceed five years from the date indicated.

Some thought that substitutes, such as cement, would curtail the demands for lumber. Judging from the experience of other countries they would not; even in England, where nearly all of the lumber used was imported, their lumber consumption per capita was increasing at the rate of 5 per cent. per annum. In France and this country it was increasing at the rate of 10 per cent. per capita.

Speaking of methods of conservation, Mr. Long said:

"The government, owning only about 22 per cent. of the forest areas, can not alone, to any great degree, effect what we are seeking in this conference so far as forests are concerned. It might, however, accomplish the purpose in one of the following ways.

"First.—The government could, by a contractual relation with the owners of the forests where lumbering operations are now being carried on (who constitute at least 80 per cent. of the timber holders of the United States), provide that conservation and reforestation should be practiced under rules prescribed by the Forestry Department and assess the cost thereof against the timber lands proportionately.

"These rules should provide that the lumbering operations, so far as conservation and reforestation were concerned, should be conducted under governmental control; that no more timber should be cut than was necessary to supply the current demands, thus maintaining such uniformity of prices as would justify the operator to utilize every log the tree would produce; that only trees of a certain size should be cut; that seed trees, properly distributed, should be left; that the young growth should be protected from fire and other elements of destruction, and it would seem clear that the establishment of such a relationship would certainly accomplish this highly desired object.

"Second.—A plan might be worked out jointly between the owners of the timber lands and the government by which conservation and reforestation would be practiced along such lines as the government might lay down, as outlined above, and the timber owners protected in the prices of all lands cut over and handled under the conditions prescribed.

"Whatever plan is adopted must furnish an incentive, a substan-

tial inducement, to the timber owners to forego a present gain for the public good, and in this matter it can be accomplished only by governmental co-operation. And what is done should be done quickly, for the time is fast approaching when our forests will be so nearly gone, when the destruction will be so nearly completed, that it will be too late."

Mr. Robert Fullerton of Des Moines, Iowa, in the course of an address, said:

"We can conserve our forests resources and prolong their existence somewhat by cutting only the full grown, mature trees and protecting the young growth for future use; but this method of lumbering means dearer lumber for our present generation. Logging operations as now conducted require a system of railroads traversing the timber holdings, built at considerable cost, to obviate the time and expense of long hauls by oxen and horses; so that economy and competition compel the average saw mill operator to cut all his trees that will make merchantable lumber. He can see nothing but bankruptcy in holding his young trees for twenty or forty years, paying interest and taxes on the investment while waiting. His holdings may be limited to ten of fifteen years' operation, cutting his land clean, and only half this time if logging nothing but mature timber leaving his plant idle, to rot down, in the interest of posterity. Suppose the millmen should leave standing all half grown trees 12 inches and less in diameter; it would require thirty-two years' growth and protection for these 12-inch trees to reach 20 inches in diameter, allowing a quarter of an inch for the annual growth, which is a liberal and thrifty increase for an average yellow pine forest. Any schoolboy can estimate the cost of saw logs on which the interest and taxes are compounded for thirty years, counting the original value of his stumpage at the nominal price of \$2 a thousand feet. Pine lands, usually sandy barrens, afford little or no income from pasturage while waiting for their natural crops to mature. There is also some risk of loss from fire, insects and cyclonic storms to be taken into account in a twenty or thirty years' speculation.

"In this graceless year of 1908 yellow pine lumber is selling at less than cost of production, and is relatively cheaper than Iowa corn when farmers sold their surplus at 15 cents a bushel. And still the newspapers, seeing no income from lumber advertisements in their financial columns, iterate their harmless sting of 'lumber trust,' and the imagination of some politicians and public prosecutors conceives the possibility of a wicked combination embracing more than 20,000 independent saw mills scattered over nearly every state in the Union, from Maine to California! A corner on the atmosphere or God's universal sunlight would be no less absurd.

"Some of our learned professional foresters advocate planting and propagating pine and oak forest trees from seed. This method of renewing our lumber resources is altogether a hopeless proposition for the individual citizen to engage in. It would require 100 years to produce from the seed a pine or oak tree suitable for lumber, and then they would be only half grown. The fact that an acre of the finest southern pine or oak stumpage can be bought to-day for \$50, covered with a crop of trees requiring 200 years to mature, gives some idea of the returns to be expected from forest tree farming. Forestry experts, quoting the experience of European countries in tree culture, base their figures mainly on broad leaved trees of rapid growth, planted in soil that produces grass, and the profits from pasturage help pay the interest on their waiting investment. The state or the nation having an eternity of existence and the taxing power might engage in the work of reforestation, but for the individual to plant pine trees for lumbering purposes is impracticable and as visionary as the coming of the millenium or the discovery of perpetual motion.

"Our railroads could assist greatly in economizing our waning timber resources by creosoting their ties and all exposed timbers used in their roadbeds, doubling their life and their cost—justifying (?) an advance in freight rates which might not please shippers demanding reductions in transportation charges. We are using up 7,000,000,000 feet of boards annually in making packing boxes. These boxes usually make but one trip, are broken up for kindling wood or otherwise wasted. Dearer lumber would result in goods boxes being returned and used over and over again, as practiced in European countries. We can use brick, stone and cement in building our houses. The material to make brick and cement is limitless. We can substitute tile for shingles. We use some 4,000,000,000 feet of wood yearly in making paper pulp—another sacrifice of our natural resources in the ostensible interest of civilization. And just now the newspaper publishers of our country are besieging Congress to legislate for cheaper paper and add a new stimulation to the consumption of our waning forests—and enable our newspapers to devote more space to Peruna advertisements and baseball extras and increase our postal deficit by loading down the mails with their Sunday editions and colored supplements, as glaring as an Indian chief in his warpaint and just as far removed from any useful purpose or civilizing influence. Paper is too cheap now if forest economy is desirable. But no consideration for future generations will influence or prevent the American citizen from using the cheapest, most convenient material for his present needs

THE FRED S. MORSE LUMBER COMPANY

A Progressive Firm Operating in Canada and the United States

Fred S. Morse,
President Fred S. Morse Lumber Company.

The Fred S. Morse Lumber Company of Springfield, Mass., is well known to the lumber buyers, as well as the lumber operators throughout Eastern Canada, having maintained an office for several years in Montreal, with Mr. T. Frankfurdt Story as selling representative, while the head of the company, Mr. Fred S. Morse, has long been identified with lumbering enterprises along the line of the I. C. R. and was one of the original stockholders and directors of the Trois Pistoles Pulp & Lumber Company, twenty-eight miles east of Riviere de Loup. The Montreal office of the Morse Company, wholesalers, has just been moved to 116 Agnes street, St. Henry. Mr. Morse and his associates have just developed a new enterprise in Canada, a com-

pany, of which he is the treasurer and active head, having been incorporated at Bathurst, N.B., under the laws of the Dominion of Canada to take over the cedar shingle operations of the O. F. Stacy Company, Limited, who had long been identified with the business at Bathurst. The new company was formally organized on April 21st at a meeting held in Bathurst. It will be known as the Nepisquit Lumber Company, Limited, and will have a capital of \$100,000.

The following officers were chosen: President, Ralph W. Ellis, Springfield, Mass.; vice-president, Charles D. Ordway, Burlington, Vt.; treasurer, Fred S. Morse, Springfield, Mass.; secretary, A. W. MacRae, St. John, N. B. These with Walter P. Dodge, Edward O. Sutton and Samuel M. Green, Springfield and William G. White, Bathurst, N. B. will constitute the Board of Directors.

This new organization has taken over the timber limits, or at least the right to cut all the cedar, from 318,000 acres, formerly in the hands of the O. F. Stacy Company, Limited. The transfer includes the old Stacy plant comprising a shingle mill, stables, general store, office, etc. in Bathurst, a second mill at Nigadoo, and the Bear Houses and all supply camps scattered throughout the operations. The company will operate eight machines, the product being shipped by rail entirely over the Intercolonial Railway, having direct connections through to all points in New England and the Middle States. This product will be sold entirely by the Fred S. Morse Lumber Company, of Springfield, Mass., and Montreal. The mill at Bathurst has been thoroughly rebuilt and modernized in every respect, a new power plant having been added and equipped with two boilers of 150 horse power each. The product will be shipped under the special brands of the Fred S. Morse Lumber Company and will be brought up to the highest standard of grades known to the New Brunswick cedar shingle industry. The securities necessary for taking over this new operation have all been sold, largely to friends of Mr. Morse, who have full confidence in his ability and integrity.

It is interesting to note in this connection that Mr. Morse is not classed as among the oldest lumbermen in his home state. He is a native of Waldoboro, Maine, where he was born in 1866. His first commercial enterprise was the vending of newspapers on the streets of Nashua, N. H. He first became identified with the lumber industry wearing a canvas apron on one of the big lumber yards of Burlington, Vt. Before coming into the lumber business as a principal he had handled all classes of lumber in all ways from tally boy and inspector right through the list to retail yard and manager and salesman on the road. After seventeen years of service in these various fields, on February 1st, 1899, he commenced in the wholesale lumber business on his own account in Springfield. He started on that good and sound

basis of paying cash for all purchases and has held strictly to a cash basis ever since, so that to-day no wholesaler stands higher with the shippers than the Fred S. Morse Lumber Company. With his force of salesmen he has pretty thoroughly covered the New England and New York State territory and Eastern Canada, and his company now has the selling, throughout New England, of the white pine from White, Gratwick & Mitchell of Tonawanda, the maple, beech and birch flooring of Cobbs & Mitchell, Inc. of Michigan, and in New York the maple and beech flooring of Mitchell Bros. His company also handles a complete line of Louisiana red cypress, long and short leaf yellow pine, hardwoods, New York State and Quebec spruce, Pacific Coast cedar shingles, and now this substantial white cedar shingle output of the Nepisquit Lumber Company.

During the past few years the Morse office has been in the Whitney Building on Main street, but on June 1st it will be removed to the sixth floor of the new and modern Phelps Building now about completed, where the company will have 1,700 feet of floor space specially arranged and equipped for the convenience of this growing business. The new building is of reinforced concrete, 100 by 300 feet on the ground and eight stories in height. The company's selling force will be made up of Geo. L. Sanford, office manager; Fred A. Holbrook, Winthrop G. Richmond and Lee G. Bloom, salesmen, who will make their headquarters at the Springfield office and T. Frankfurdt Story, the company's Canadian representative.

Mr. Story has been identified with the Fred S. Morse Lumber Company for several years, making Montreal his headquarters and covering the Provinces of Quebec and Ontario. He is well known to the dealers in these sections and is classed as one of the successful salesmen in Eastern Canada. Mr. Story was born at Plantagenet, Ontario, in 1874 and left home at the age of 17 to teach school, which profession he followed for about three years, afterwards going to Ottawa to learn the lumber business. There, he started at handling and loading deals in a small retail yard, afterwards becoming its salesman. After several years' experience there in the yard and planing mill, he went with the firm of Messrs. Cameron & Company, Limited, of Ottawa, with whom he remained for over three years in the capacity of culler, shipper and buyer. After severing his connection with this firm he went with the Ottawa Lumber Company Limited, and had charge of their operations on the Rouge river. After several years' experience in sawmill and bush work and on the river, he enlisted for active service in South Africa, in December 1901, becoming a member of B. squadron of the 2nd Canadian Mounted Rifles. After a year's active service with this regiment in Cape Colony, Natal, Orange Free State and the Transvaal, he returned, receiving a Queen's S. A. medal with three clasps. He then re-entered the lumber business, this time with Messrs. Davidson & Thackray of Ottawa in the capacity of sales manager remaining with them for about three years.

In the fall of 1905, Mr. Story accepted the position of Canadian representative for the Fred S. Morse Lumber Company in which he has been very successful. It is one policy of the company to have its representatives know the lumber they sell. In order to familiarize himself thoroughly with his work, Mr. Story spent several months in the leading lumber sections of the South and West, visiting the mills from which the company draw their immense supplies. With the practical first hand knowledge thus gained, he is prepared to represent his company with a high degree of intelligence. His customers, also,

T. Frankfurdt Story,
Montreal Representative Fred S. Morse Lumber Company.

knowing that their interests are carefully looked after, have grown to have a great confidence in him, and in the company he represents.

From these facts it will be seen that while the Fred S. Morse Lumber Company cannot perhaps be classed as a veteran organization yet it has the fullest equipment, both as regards stock offerings and a strong corps of selling representatives, and should continue to win the success which has thus far come to Mr. Morse in the wholesale field. Mr. Morse himself has developed all the qualities of a thorough going man of affairs, and while he launches few commercial pyrotechnics there is always in evidence about his office a degree of well applied energy and push that keeps matters moving irresistibly forward. He is a very active member of the National Wholesale Lumber Dealers' Association, and as a tribute to his clean cut business policy he has for the past three years served as chairman of its Trade Relations committee, which handles all questions at issue between the wholesale and retail branches of the trade.

Arrangements Between Puget Sound Mills and Railways.

The lumber manufacturers of Puget Sound are to continue shipping lumber at the old rates. The court has granted the petition of the shippers that they be allowed to file group bonds for \$200,000 additional to bonds already put up to cover the difference between the old and the new freight rates on lumber shipped in the interval, in case the Interstate Commission decides against them.

The system in filing the group bonds, has progressed according to the plans of each group of manufacturers. In one case the signatures of the members of the group was all that was necessary. In another case certified cheques were filed with the bonding companies. In Tacoma each signer became responsible for the amount he signed for only. The bonds are retroactive covering all liability under the general bond previously given of \$250,000.

Another arrangement is the reporting of each shipment by the signers, the report being accompanied by a certified cheque for the difference between the old rate and the new rate on the shipment. There seems to be every indication of the rates being disallowed by the Interstate Commerce Commission. In fact many southern roads are so sure of this that they are lowering their rates to certain points covered by the Puget Sound Mills, in anticipation of having to fight for the trade after the award has been made by the Commission.

The St. John River Trouble.

Lumbermen in Canada have long been acquainted with the difficulties of an international character between log drivers on the St. John river, N.B. Few, probably, are aware of the historic origin of the trouble, which dates back to the Ashburton treaty, under which it is provided that the St. John river, where it forms the international boundary, shall at all times be free and open to the people of the two countries. A few years ago the State of Maine, acting, so New Brunswick lumbermen say, contrary to treaty rights, chartered two or more companies to build mills and river works on the St. John, and under its authority dams and log booms were put in that stream near Van Buren, Me. That was only preliminary to something else.

These companies forthwith proceeded to claim the right, and have since maintained it, to hold up the logs coming down the river until they have sorted them and secured their own; and in the exercise of this royal grant of power they took over and used in one season some 10,000 sticks of timber in which they had no property right, giving as an excuse for the proceeding that, by the time their sorting work was completed, the freshet had passed and, consequently, if the logs not theirs had been let go their owners would have suffered heavy loss. This was in the first season of the trouble. In the succeeding year logs were similarly held up, with the result that their owners, it is alleged, suffered considerable pecuniary losses. These interruptions to the drives of the companies operating in New Brunswick have stirred up considerable feeling, to be sure, and there have been serious collisions between employees and others.

Involved in the suit is the question of the correct definition of the word "channel" as applied to a river. Naturally enough, in the circumstances, law suits and diplomacy have become mixed up in the issue. The attorney general of New Brunswick brought the legal proceedings, but the case was postponed on the understanding that the matter would be taken up by the International Waterways Commission. But that body did not seem to be competent under its grant of authority to settle the question and, finally realizing this fact, the Canadian Minister of Public Works had a bill introduced in the House of Commons to prevent any boom being attached to the Canadian bank, except under license of the government of Canada.

Senator Hale's bill to prevent the importation into the United States of lumber owned and cut by Americans, is regarded by the New

Brunswickers as a bit of retaliation for the measure introduced in the House of Commons; and if it should be enacted into legislation, very considerable duty-free shipments of lumber to the United States would be cut off. There are three American firms in the city of St. John alone that send between 60,000,000 and 65,000,000 feet of lumber into the United States annually. They are Andrew Cushing & Company, Stetson, Cutler & Company, and J. R. Warner & Company.

Senate Killed Lumber Company's Bill.

The Senate Railway Committee has killed the bill to incorporate the Shuswap and Thomson Rivers Boom Company. The measure had passed the Commons, shorn of some of its original provisions. Rival lumber interests were represented, either for or against the bill, and it was quite evident from the large attendance that there had been a very active lobby. The City of Kamloops filed a protest against the measure as calculated to be injurious to the town, but as the question chiefly discussed was the competency of the Dominion Parliament to pass an act of this kind, the Union of Canadian Municipalities had simply a watching brief.

At the outset of the proceedings the chairman read an opinion from Mr. Creighton, law clerk of the Senate, setting forth that as the works contemplated by the bill were entirely within the Province of British Columbia, and as the business of the proposed company was altogether local, he thought that, in the absence of an express declaration, that the proposed works were for the general advantage of Canada, the incorporation of such a company was outside the jurisdiction of the Dominion Parliament.

Irish Forestry Report

London reports state that the government department committee which has been inquiring into Irish forestry, reports to Parliament that the United States, is consuming its timber and destroying its forests to an alarming extent. It says that a timber famine is coming in seven-league boots.

Evidence was given before the committee that Canada's supply is also in danger, and is likely in the future to be heavily encroached on by the United States. About a third of the supply of timber coming into the United Kingdom, or nearly £7,000,000 (\$35,000,000) worth annually, comes from these countries.

In consequence of this state of things there is felt in the British market an increase in the price of foreign timber and deterioration in its quality. The prices of some varieties have gone up 30 to 40 per cent. in twenty years, and, making allowance for improved methods of manipulation and for the fact that so much of the foreign timber now comes into the market in a highly prepared state, the net increase is probably more than these figures represent.

All British and Irish witnesses who have given evidence state that the quality of foreign timber is markedly inferior to what it used to be, a fact which indicates that the chief timber producing countries are using up at home the best of their own supplies.

Timber for Western Gap, Toronto.

Gill and Fortune, lumber manufacturers and dealers, Trenton, Ont., have been successful in closing a contract for supplying about 5,000,000 feet of timber, required for the construction of the new western gap at Toronto. The contract was made with Mr. R. Weddell, who obtained from the Dominion Government the contract for carrying out the work of constructing the gap. Delivery of the timber is to be made this season, by rail. It is expected that work will start at once upon the construction of the gap and be pushed rapidly to completion.

We regret to receive word from Gordon Grant & Company, Port of Spain, Trinidad, of the death of Mr. George Francis Bushe. Mr. Bushe, who had been an active member of the firm for the past seven years, died suddenly in England, on May 1. Gordon Grant & Company also advise us that Mr. Reginald E. Harriss has retired from their service, and that the powers of procuration hitherto granted to Henry Foderingham Smith and William Hadden will be exercised by them severally. The same authority has been extended to Alexander Rae and A. S. Jardine jointly.

Mr. C. J. Burchard has resigned his position as manager of the lumber department of the St. Anthony & Dakota Elevator Company, of Minneapolis, and will operate a line of yards in the surrounding country from Saskatoon, Sask. The company will be known as the Burchard Lumber Company, Limited. Mr. Burchard has had twenty-one years' experience in the lumber business. He is well-known in Minneapolis and has a host of friends who wish him every success in his new business.

THE WOODWORKER

Conditions Improving.

There is not much doubt that the indications to-day are for improvement in business. An exchange speaking of the package trade says: While there is little change reported in business conditions, it is certain that there are no more discouraging features. But in viewing the situation with reference to the coming months, there is considerable encouragement to be seen for the package manufacture. It is reported from New York that conditions are not nearly as strained in financial affairs as they were a few months ago. In many instances, borrowing on a large scale by the various railroad systems has been resumed and the various departments have been ordered to go on with their construction work. This means the large purchase of supplies, as well as the putting to work of thousands of men who have been idle for a considerable time. These men will accordingly have their purchasing power increased, and it is believed that trade in general will soon be upon a more normal basis although it may not reach the large proportions of 1907. All of this is good news to the package trade.

The cooperage trade has suffered perhaps as much as any part of the package industries, as the cooper has had not only the financial trouble to contend with, but his operations have been, to some extent, curtailed through the temperance agitation that has been strong in some sections of the country.

To the slack cooper, at least, now comes the good news that the fruit outlook is very promising in all parts of the country, which will, a little later in the season, give him some relief from the dull trade that has characterized his business for the past few months. From all over the country come such reports as "enormous yield," "bumper crop," etc., while little is said of frost damage and other discouraging features. Taking it all around the package manufacturer has occasion to feel that the outlook for trade in his line is much better than it has been at any time this year.

Cooperage Mills Busy.

Jas. Innes, of the Sutherland-Innes Cooperage Company, Limited, Chatham, Ont., reports that the mills have started jointing this year's cut and filling urgent orders. Those mills that have kilns are busy running the kilns to their full capacity, as the demand for this season of the year is very much better than usual for staves; very few of the consumers have any stock on hand, and of course the mills are absolutely cleaned out of the old stock. While this is the presidential year, the outlook is exceptionally good for the cooperage industry.

The government reports are, that the apple trees have come through the winter in first class shape, and if nothing untoward happens during the flowering season, the prospects are good for an excellent crop of apples.

The general business throughout the country is regaining confidence and the demand for the general consumption is above the average of recent years. The mills report, on an average, very light stocks of timber, partly caused by the very heavy snows which impeded logging and partly by the difficulty of obtaining money to stock up the mills. The present indications point to a considerable advance in the price of cooperage stock, more especially staves, before long. Staves have remained steady throughout the whole financial depression. Heading has been a little too high for the ideas of the consumers, while hoops at the present time are lower than they have been for months.

The hoop manufacturers seem anxious to realize on their hoops so as to get money to carry on their operations, and this no doubt has a great deal to do with the present low price of hoops, which are down below the \$9 basis for 6-foot hoops, and when they get below this, the danger mark to the manufacturer has been reached. With the new staves coming in, however, there will be greater demand for hoops, and we look for a considerable advance in the near future. The demand for tight barrel stock is also looking up.

On the whole, the prospects for the cooperage industry are very good for this year, and we look forward to a very busy season.

It's not the greatest quantity of glue you can get on a piece of work that makes the best glue joint. What is wanted is close contact, with the glue spread evenly and thin. Of course, the quality of the glue has a lot to do with it, too.

Hewed ties, which are peeled when cut, season much more rapidly during the first four months than unpeeled ties. At the end of a year's seasoning, however, the weights of both peeled and unpeeled ties are approximately uniform.

Glue for Veneers.

For veneering purposes or inlaying, procure a light brown article, one free from streaks and semi-transparent. This should be dissolved in water in the usual way. To a quart of it add a gill of pure strong cider vinegar and an ounce of so-called isinglass, says A. A. Kelly, in Woodcraft.

The addition of tannic acid renders ordinary glue waterproof.

Glue may be made to dry so hard as to defy even hot water, by adding bichromate of potash. A very small quantity is enough, say one-fifteenth as much as the glue. After the article has been glued, it should be placed in the light. The light causes it to become insoluble. There are other formulas for this purpose, but the bichromate method is as good as can be devised.

Glue deteriorates from frequent heating so that for particular jobs it is best to use fresh glue. The hotter the glue the better the joint will hold. This is especially true of large and long joints, to which the glue should be applied quite hot and fresh.

Glue dissolved in skim milk makes a very strong cement, and the addition of dry powdered lime increases its strength. A pound of glue is added to three pints of milk.

The strength of a glued joint is as follows:

	Pounds per square inch.	
	Across the grain End to end	With the grain Side strain
Beech	2,133	1,095
Elm	1,436	1,124
Oak	1,735	568
Whitewood	1,493	341
Maple	1,422	896

It is usual to estimate the actual resistance which joints glued together can stand in continued use by employing only one-sixth to one-tenth of these values.

Hitches That Cause Damage.

We all know that hitches in the planer feed cause the lumber to stick and fail to move through for a moment or two, says The Woodworker, and frequently causes the planer knives to make a little hollow mark, and sometimes they scorch the wood a little, and if one tries to do a neat job of finishing it leaves ugly marks on the face that seriously damage its appearance. This is not so serious, however, as when the feed of a drum sander hitches in the same way, because the drum of a sanding machine will scorch a place across the face of stock almost as quick as a wink, and these scorched places are, at times, very difficult to remove. In some classes of work it may not amount to anything serious, but on many of the finer jobs being done these days, these hitches and scorched places resulting are a source of serious damage, and it frequently tries the metal of a man operating the machine to keep the rolls and bed low enough to prevent rough work and at the same time carry the stock freely enough to insure it against these little hitches or stops in the feed that do so much damage. For one thing it calls for a man having his rolls very carefully in line, and not high on one end and low on the other, so the only way to feel really safe about it is to carefully test the rolls and the bed every once in a while, with a good straightedge. Then keep both the beds and the rolls in excellent order, so that there may be the least possible amount of friction. It is close attention to these things that insures good work. Any neglect that begets hitches, causes damage and makes it difficult for the institution to maintain its reputation for good work. To-day it is not the quantity you get through so much as the shape in which it comes through, that counts. Of course, every man wants to do a fair amount of work, but he should always keep in mind that the first essential is to have the work well done.

Wine and Wood.

Dr. Hermann von Schrenk, St. Louis, at a recent meeting of the National Coopers' Association told of some experiments made with barrels of various woods. A pure grape wine was packed in each for a period of one month. The wine from the white oak barrel was apparently the same as when first placed in the package. The cypress barrel had little effect upon it but the cedar barrel had given the wine a pungent odor and a marked resinous taste, and the redwood barrel turned the wine to a sassafras color and the taste had undergone a pronounced alteration.

Box Factory Ideas.

Box manufacturers will be interested in the following observations by a correspondent of Packages.

One of the curiosities of the box factory and the stave mill is the number of engines one finds that are running "under," as it is called. It may be that when purchasing the engine for some, or all of those I have seen, the engine may have been running that way and it was just continued in that shape. It always looked to me like a woman throwing a stone at a chicken to see an engine running like this. In many of the cases noted the slack side of the belt was on the under side; a position in which it is usually hard to rig a satisfactory tightener. An engine running "over" with the slack of the belt on top is an easier one to set up and a more serviceable one to maintain. Some engineers have made the assertion that running an engine "under" is the proper way, but this is a mistake from my point of view. The pressure on the slides from the crossheads is downward on an engine running "over," and upward on the engine running "under." The frame of an engine is made to carry this strain and it is not a good idea to put it on the upper part of the slides, even if the slides are heavy. Many engines are designed with the idea of this strain being put on the bed, and are not expected to be run in any other way.
